DESCRIPTION

The HLC1395 is a miniature infrared sensor designed to sense reflective objects at short distances. Both the GaAs IRED and the NPN phototransistor are mounted side-by-side in a single black plastic package with an integral barrier to minimize crosstalk. The sensor is configured with the IRED cathode and the phototransistor emitter connected to a common lead.

The housing consists of an opaque polysulfone outer shell with transfer-molded, IR-transmissive epoxy encapsulant. Housings are soluble in chlorinated hydrocarbons and ketones. Recommended cleaning agents are methanol and isopropanol.

1. Test surface is Eastman Kodak neutral white test card with 90% diffuse reflectance located 0,040 in. (1.0 mm) from the front surface of the device.
2. Crosstalk (I_{CX}) is the collector current measured with current to emitter and no reflecting surface.
