

# ADT7460

## dBCOOL<sup>®</sup> Remote Thermal Monitor and Fan Controller

The ADT7460 dBCOOL controller is a thermal monitor and multiple PWM fan controller for noise-sensitive applications requiring active system cooling. It can monitor the temperature of up to two remote sensor diodes plus its own internal temperature. It can measure and control the speed of up to four fans so that they operate at the lowest possible speed for minimum acoustic noise. The automatic fan speed control loop optimizes fan speed for a given temperature. A unique dynamic T<sub>MIN</sub> control mode enables the system thermals/acoustics to be intelligently managed. The effectiveness of the system's thermal solution can be monitored using the THERM input. The ADT7460 also provides critical thermal protection to the system by using the bidirectional THERM pin as an output to prevent system or component overheating.

### Features

- Controls and Monitors Up to 4 Fans
- 1 On-Chip and 2 Remote Temperature Sensors
- Dynamic T<sub>MIN</sub> Control Mode Optimizes System Acoustics Intelligently
- Automatic Fan Speed Control Mode Controls System Cooling Based on Measured Temperature
- Enhanced Acoustic Mode Dramatically Reduces User Perception of Changing Fan Speeds
- Thermal Protection Feature via THERM Output
- Monitors Performance Impact of Intel Pentium<sup>®</sup> 4 Processor
- Processor Thermal Control Circuit via THERM Input
- 2-Wire and 3-Wire Fan Speed Measurement
- Limit Comparison of All Monitored Values
- Meets SMBus 2.0 Electrical Specifications (Fully SMBus 1.1-Compliant)
- This is a Pb-Free Device

### APPLICATIONS

- Low Acoustic Noise PCs
- Networking and Telecommunications Equipment

ON Semiconductor<sup>®</sup>

### ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 45 of this data sheet.

# ADT7460

Figure 1. Functional Block Diagram

## ABSOLUTE MAXIMUM RATINGS

Parameter	Rating	Unit
Positive Supply Voltage ( $V_{CC}$ )	6.5	V
Voltage on Any Input or Output Pin	-0.3 to +6.5	V
Input Current at Any Pin	$\pm 5$	mA
Package Input Current	$\pm 20$	mA
Maximum Junction Temperature ( $T_{JMAX}$ )	150	$^{\circ}C$
Storage Temperature Range	-65 to +150	$^{\circ}C$
Lead Temperature, Soldering		$^{\circ}C$
IR Reflow Peak Temperature	220	
IR Reflow Peak Temperature for Pb-Free	260	
Lead Temperature (Soldering, 10 sec)	300	
ESD Rating	1500	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

NOTE: This device is ESD sensitive. Use standard ESD precautions when handling.

## THERMAL CHARACTERISTICS

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
16-lead QSOP	150	39	$^{\circ}C/W$

1.  $\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered in a circuit board for surface-mount packages.

# ADT7460

## PIN ASSIGNMENT

Pin No.	Mnemonic	Description
1	SCL	Digital Input (Open Drain). SMBus serial clock input. Requires SMBus pullup.
2	GND	Ground Pin for the ADT7460.
3	V <sub>CC</sub>	Power Supply. Can be powered by 3.3 V standby if monitoring in low power states is required. V <sub>CC</sub> is also monitored through this pin. The ADT7460 can also be powered from a 5.0 V supply. Setting Bit 7 of Configuration Register 1 (Reg. 0x40) rescales the V <sub>CC</sub> input attenuators to correctly measure a 5.0 V supply.
4	TACH3	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 3. Can be reconfigured as an analog input (AIN3) to measure the speed of 2-wire fans.
5	PWM2	Digital Output (Open Drain). Requires 10 kΩ typical pullup. Pulse-width modulated output to control Fan 2 speed.
	$\overline{\text{SMBALERT}}$	Digital Output (Open Drain). This pin may be reconfigured as an $\overline{\text{SMBALERT}}$ interrupt output to signal out-of-limit conditions.
6	TACH1	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 1. Can be reconfigured as an analog input (AIN1) to measure the speed of 2-wire fans.
7	TACH2	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 2. Can be reconfigured as an analog input (AIN2) to measure the speed of 2-wire fans.
8	PWM3	Digital I/O (Open Drain). Pulse-width modulated output to control Fan 3/4 speed. Requires 10 kΩ typical pullup.
	ADDRESS ENABLE	If pulled low on powerup, this places the ADT7460 into address select mode, and the state of Pin 9 determines the ADT7460's slave address.
9	TACH4	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 4. Can be reconfigured as an analog input (AIN4) to measure the speed of 2-wire fans.
	ADDRESS SELECT	If in address select mode, this pin determines the SMBus device address.
	THERM	Alternatively, the pin may be reconfigured as a bidirectional THERM pin. Can be used to time and monitor assertions on the $\overline{\text{THERM}}$ input. For example, can be connected to the $\overline{\text{PROCHOT}}$ output of Intel's Pentium 4 processor or to the output of a trip point temperature sensor. Can be used as an output to signal overtemperature conditions.
10	D2-	Cathode Connection to Second Thermal Diode.
11	D2+	Anode Connection to Second Thermal Diode.
12	D1-	Cathode Connection to First Thermal Diode.
13	D1+	Anode Connection to First Thermal Diode.
14	+2.5 V <sub>IN</sub>	Analog Input. Monitors 2.5 V supply, typically a chipset voltage.
	$\overline{\text{SMBALERT}}$	Digital Output (Open Drain). This pin may be reconfigured as an $\overline{\text{SMBALERT}}$ interrupt output to signal out-of-limit conditions.
15	PWM1/XTO	Digital Output (Open Drain). Pulse-width modulated output to control Fan 1 speed. Requires 10 kΩ typical pullup.
16	SDA	Digital I/O (Open Drain). SMBus bidirectional serial data. Requires SMBus pullup.

# ADT7460

## Product Description

The ADT7460 is a thermal monitor and multiple fan controller for any system requiring monitoring and cooling. The device communicates with the system via a serial System Management Bus (SMBus). The serial bus controller has an optional address line for device selection (Pin 9), a serial data line for reading and writing addresses and data (Pin 16), and an input line for the serial clock (Pin 1). All control and programming functions of the ADT7460 are performed over the serial bus. In addition, two of the pins can be reconfigured as an  $\overline{\text{SMBALERT}}$  output to indicate out-of-limit conditions.

## Measurement Inputs

The device has three measurement inputs, one for voltage and two for temperature. It can also measure its own supply voltage and can measure ambient temperature with its on-chip temperature sensor.

Pin 14 is an analog input with an on-chip attenuator and is configured to monitor 2.5 V.

Power is supplied to the chip via Pin 3, and the system also monitors  $V_{CC}$  through this pin. In PCs, this pin is normally connected to a 3.3 V standby supply. This pin can, however, be connected to a 5.0 V supply and monitor it without over-ranging.

Remote temperature sensing is provided by the  $D1\pm$  and  $D2\pm$  inputs, to which diode-connected, external temperature-sensing transistors, such as a 2N3904 or CPU thermal diode, may be connected.

The ADC also accepts input from an on-chip band gap temperature sensor, which monitors system ambient temperature.

## Sequential Measurement

When the ADT7460 monitoring sequence is started, it cycles sequentially through the measurement of 2.5 V input and the temperature sensors. Measured values from these inputs are stored in value registers. These can be read out over the serial bus or can be compared with programmed limits stored in the limit registers. The results of out-of-limit comparisons are stored in the status registers, which can be read over the serial bus to flag out-of-limit conditions.

## Recommended Implementation

Configuring the ADT7460 as in Figure 12 allows the systems designer the following features:

- ♦ Two PWM outputs for fan control of up to three fans (the front and rear chassis fans are connected in parallel).
- ♦ Three TACH fan speed measurement inputs.
- ♦  $V_{CC}$  measured internally through Pin 3.
- ♦ CPU temperature measured using Remote 1 temperature channel.
- ♦ Ambient temperature measured through Remote 2 temperature channel.
- ♦ Bidirectional  $\overline{\text{THERM}}$  pin. Allows Intel Pentium 4  $\overline{\text{PROCHOT}}$  monitoring and can function as an overtemperature  $\overline{\text{THERM}}$  output.
- ♦  $\overline{\text{SMBALERT}}$  system interrupt output.

Figure 12. Recommended Implementation

# ADT7460

## ADT7460 Address Selection

Pin 8 is the dual-function PWM3/ADDRESS ENABLE pin. If Pin 8 is pulled low on powerup, the ADT7460 reads the state of Pin 9 (TACH4/ADDRESS SELECT/THERM) to determine the ADT7460's slave address. If Pin 8 is high on powerup, the ADT7460 defaults to SMBus Slave

Address 0x2E. This function is described in more detail later.

## Internal Registers of the ADT7460

Table 1 summarizes the ADT7460's principal internal registers. Table 38 to Table 78 describe the registers in more detail.

**Table 1. Summary Internal Registers**

Register	Description
Configuration	These registers provide control and configuration of the ADT7460, including alternate pinout functionality.
Address Pointer	This register contains the address that selects one of the other internal registers. When writing to the ADT7460, the first byte of data is always a register address, which is written to the address pointer register.
Status Registers	These registers provide the status of each limit comparison and are used to signal out-of-limit conditions on the temperature, voltage, or fan speed channels. If Pin 14 or Pin 5 is configured as SMBALERT, this pin asserts low whenever an unmasked status bit is set.
Interrupt Mask	These registers allow each interrupt status event to be masked when Pin 14 or Pin 5 is configured as an SMBALERT output.
Value and Limit	The results of analog voltage input, temperature, and fan speed measurements are stored in these registers, along with their limit values.
Offset	These registers allow each temperature channel reading to be offset by a two's complement value written to these registers.
T <sub>MIN</sub>	These registers program the starting temperature for each fan under automatic fan speed control.
T <sub>RANGE</sub>	These registers program the temperature-to-fan speed control slope in automatic fan speed control mode for each PWM output.
Operating Point	These registers define the target operating temperatures for each thermal zone when running under dynamic T <sub>MIN</sub> control. This function allows the cooling solution to adjust dynamically in response to measured temperature and system performance.
Enhance Acoustics	These registers allow each PWM output controlling fan to be tweaked to enhance the system's acoustics.

## Theory of Operation

### Serial Bus Interface

Control of the ADT7460 is carried out using the serial System Management Bus (SMBus). The ADT7460 is connected to this bus as a slave device, under the control of a master controller.

The ADT7460 has a 7-bit serial bus address. When the device is powered up with Pin 8 (PWM3/ ADDRESS ENABLE) high, the ADT7460 has a default SMBus address of 0101110 or 0x2E. If more than one ADT7460 is to be used in a system, each ADT7460 should be placed in address select mode by strapping Pin 8 low on powerup. The logic state of Pin 9 then determines the device's SMBus address. The logic state of these pins is sampled on powerup.

The device address is sampled and latched on the first valid SMBus transaction, more precisely, on the low-to-high transition at the beginning of the eighth SCL pulse, when the serial address byte matches the selected slave address. The selected slave address is chosen using the ADDRESS ENABLE/ADDRESS SELECT pins. Any attempted changes in the address has no effect after this.

**Table 2. Address Select Mode**

Pin 8 State	Pin 9 State	Address
0	Low (10 kΩ to GND)	0101100 (0x2C)
0	High (10 kΩ pullup)	0101101 (0x2D)
1	Don't Care	0101110 (0x2E) (default)

**Figure 13. Default SMBus Address 0x2E**

**Figure 14. SMBus Address 0x2C (Pin 9 = 0)**

Figure 15. SMBus Address 0x2D (Pin 9 = 1)

CARE SHOULD BE TAKEN TO ENSURE THAT PIN 8 (PWM3/ADDR\_EN) IS EITHER TIED HIGH OR LOW. LEAVING PIN 8 FLOATING COULD CAUSE THE ADT7460 TO POWERUP WITH AN UNEXPECTED ADDRESS.  
NOTE THAT IF THE ADT7460 IS PLACED INTO ADDRESS SELECT MODE, PINS 8 AND 9 CAN BE USED AS THE ALTERNATE FUNCTIONS (PWM3, TACH4/THERM) ONLY IF THE CORRECT CIRCUIT IS MUXED IN AT THE CORRECT TIME.

Figure 16. Unpredictable SMBus Address if Pin 8 is Unconnected

The facility to make hardwired changes to the SMBus slave address allows the user to avoid conflicts with other devices sharing the same serial bus, for example, if more than one ADT7460 is used in a system.

The serial bus protocol operates as follows:

1. The master initiates data transfer by establishing a start condition, defined as a high-to-low transition on the serial data line SDA while the serial clock line SCL remains high. This indicates that an address/data stream will follow. All slave peripherals connected to the serial bus respond to the start condition and shift in the next eight bits, consisting of a 7-bit address (MSB first) plus a R/W bit, which determine the direction of the data transfer, that is, whether data is written to or read from the slave device.

The peripheral whose address corresponds to the transmitted address responds by pulling the data line low during the low period before the ninth clock pulse, known as the Acknowledge bit. All other devices on the bus now remain idle while the selected device waits for data to be read from or written to it. If the R/W bit is a 0, the master writes

to the slave device. If the R/W bit is a 1, the master reads from the slave device.

2. Data is sent over the serial bus in sequences of nine clock pulses, eight bits of data followed by an Acknowledge bit from the slave device. Transitions on the data line must occur during the low period of the clock signal and remain stable during the high period, as a low-to-high transition when the clock is high may be interpreted as a stop signal. The number of data bytes that can be transmitted over the serial bus in a single read or write operation is limited only by what the master and slave devices can handle.
3. When all data bytes have been read or written, stop conditions are established. In write mode, the master pulls the data line high during the 10th clock pulse to assert a stop condition. In read mode, the master device overrides the acknowledge bit by pulling the data line high during the low period before the ninth clock pulse. This is known as No Acknowledge. The master then takes the data line low during the low period before the 10th clock pulse, then high during the 10th clock pulse to assert a stop condition.

Any number of bytes of data may be transferred over the serial bus in one operation, but it is not possible to mix read and write in one operation because the type of operation is determined at the beginning and cannot subsequently be changed without starting a new operation.

In the case of the ADT7460, write operations contain either one or two bytes, and read operations contain one byte.

To write data to one of the device data registers or read data from it, the address pointer register must be set so that the correct data register is addressed. Then data can be written in that register or read from it. The first byte of a write operation always contains an address that is stored in the address pointer register. If data is to be written to the device, the write operation contains a second data byte that is written to the register selected by the address pointer register.

This is illustrated in Figure 17. The device address is sent over the bus followed by R/W being set to 0. This is followed by two data bytes. The first data byte is the address of the internal data register to be written to, which is stored in the address pointer register. The second data byte is the data to be written to the internal data register.

## ADT7460

**Figure 17. Writing a Register Address to the Address Pointer Register, then Writing Data to the Selected Register**

When reading data from a register, there are two possibilities:

- ◆ If the ADT7460's address pointer register value is unknown or not the desired value, it is first necessary to set it to the correct value before data can be read from the desired data register. This is done by performing a write to the ADT7460 as before, but only the data byte containing the register address is sent because data is not to be written to the register. This is shown in Figure 18. A read operation is then performed, consisting of the serial bus address, R/W bit set to 1, followed by the data byte read from the data register. This is shown in Figure 19.
- ◆ If the address pointer register is known to be already at the desired address, data can be read from the corresponding data register without first writing to the address pointer register, so Figure 18 can be omitted.

It is possible to read a data byte from a data register without first writing to the address pointer register if the address pointer register is already at the correct value. However, it is not possible to write data to a register without writing to the address pointer register because the first data byte of a write is always written to the address pointer register.

In Figure 17 and Figure 19, the serial bus address is shown as the default value 01011(A1) (A0), where A1 and A0 are set by the address select mode function previously defined.

In addition to supporting the Send Byte and Receive Byte protocols, the ADT7460 also supports the Read Byte

protocol (see System Management Bus specifications Rev. 2.0 for more information).

If it is required to perform several read or write operations in succession, the master can send a repeat start condition instead of a stop condition to begin a new operation.

### Write Operations

The SMBus specification defines several protocols for different types of read and write operations. The ones used in the ADT7460 are discussed below. The following abbreviations are used in the diagrams:

- S—start
- P—stop
- R—read
- W—write
- A—acknowledge
- $\bar{A}$ —no acknowledge

The ADT7460 uses the following SMBus write protocols:

### Send Byte

In this operation, the master device sends a single command byte to a slave device as follows:

1. The master device asserts a start condition on SDA.
2. The master sends the 7-bit slave address followed by the write bit (low).
3. The addressed slave device asserts ACK on SDA.
4. The master sends the register address.
5. The slave asserts ACK on SDA.
6. The master asserts a stop condition on SDA and the transaction ends.

# ADT7460

Figure 18. Writing to the Address Pointer Register Only

Figure 19. Reading Data from a Previously Selected Register

For the ADT7460, the send byte protocol is used to write to the address pointer register for a subsequent single-byte read from the same address. This is illustrated in Figure 20.

Figure 20. Setting a Register Address for Subsequent Read

If it is required to read data from the register immediately after setting up the address, the master can assert a repeat start condition immediately after the final ACK and carry out a single-byte read without asserting an intermediate stop condition.

### Write Byte

In this operation, the master device sends a command byte and one data byte to the slave device as follows:

1. The master device asserts a start condition on SDA.
2. The master sends the 7-bit slave address followed by the write bit (low).
3. The addressed slave device asserts ACK on SDA.
4. The master sends the register address.
5. The slave asserts ACK on SDA.
6. The master sends a data byte.
7. The slave asserts ACK on SDA.
8. The master asserts a stop condition on SDA to end the transaction.

This is illustrated in Figure 21.

Figure 21. Single-Byte Write to a Register

### Read Operations

The ADT7460 uses the following SMBus read protocols.

#### Receive Byte

This is useful when repeatedly reading a single register. The register address needs to have been set up previously. In this operation, the master device receives a single byte from a slave device as follows:

1. The master device asserts a start condition on SDA.
2. The master sends the 7-bit slave address followed by the read bit (high).
3. The addressed slave device asserts ACK on SDA.
4. The master receives a data byte.
5. The master asserts NO ACK on SDA.
6. The master asserts a stop condition on SDA and the transaction ends.

In the ADT7460, the receive byte protocol is used to read a single byte of data from a register whose address has previously been set by a send byte or by write byte operation.

Figure 22. Single-Byte Read from a Register

#### Alert Response Address

Alert response address (ARA) is a feature of SMBus devices that allows an interrupting device to identify itself to the host when multiple devices exist on the same bus.

The  $\overline{\text{SMBALERT}}$  output can be used as an interrupt output or can be used as an  $\overline{\text{SMBALERT}}$ . One or more outputs can be connected to a common  $\overline{\text{SMBALERT}}$  line connected to the master. If a device's  $\overline{\text{SMBALERT}}$  line goes low, the following occurs:

1.  $\overline{\text{SMBALERT}}$  is pulled low.

2. Master initiates a read operation and sends the alert response address (ARA = 0001 100). This is a general call address, which must not be used as a specific device address.
3. The device whose  $\overline{\text{SMBALERT}}$  output is low responds to the alert response address, and the master reads its device address. The address of the device is now known, and it can be interrogated in the usual way.
4. If more than one device's  $\overline{\text{SMBALERT}}$  output is low, the one with the lowest device address has priority in accordance with normal SMBus arbitration.
5. Once the ADT7460 has responded to the alert response address, the master must read the status registers and the  $\overline{\text{SMBALERT}}$  is cleared only if the error condition has gone away.

**SMBus Timeout**

The ADT7460 includes an SMBus timeout feature. If there is no SMBus activity for 25 ms, the ADT7460 assumes that the bus is locked and releases the bus. This prevents the device from locking or holding the SMBus expecting data. Some SMBus controllers cannot handle the SMBus timeout feature, so it can be disabled.

**Table 3. Configuration Register 1 (Reg. 0x40)**

Bit	Description
<6> TODIS	0: SMBus timeout enabled (default)
<6> TODIS	1: SMBus timeout disabled

**Voltage Measurement Input**

The ADT7460 has one external voltage measurement channel. It can also measure its own supply voltage,  $V_{CC}$ .

Pin 14 may be configured to measure a 2.5 V supply. The  $V_{CC}$  supply voltage measurement is carried out through the  $V_{CC}$  pin (Pin 3). Setting Bit 7 of Configuration Register 1 (Reg. 0x40) allows a 5.0 V supply to power the ADT7460 and be measured without over-ranging the  $V_{CC}$  measurement channel. The 2.5 V input can be used to monitor a chipset supply voltage in computer systems.

**Analog-to-Digital Converter**

All analog inputs are multiplexed into the on-chip, successive approximation, analog-to-digital converter. This has a resolution of 10 bits. The basic input range is 0 V

to 2.25 V, but the input has built-in attenuators to allow measurement of 2.5 V without any external components. To allow the tolerance of the supply voltage, the ADC produces an output of 3/4 full scale (768d or 0x300) for the nominal input voltage and so has adequate headroom to deal with overvoltages.

**Input Circuitry**

The internal structure for the 2.5 V analog input is shown in Figure 23. The input circuit consists of an input protection diode, an attenuator, plus a capacitor to form a first-order low-pass filter that gives the input immunity to high frequency noise.

**Table 4. Voltage Measurement Registers**

Register	Description	Default
0x20	2.5 V reading	0x00
0x22	$V_{CC}$ reading	0x00

Associated with the voltage measurement channels are a high and low limit register. Exceeding the programmed high or low limit causes the appropriate status bit to be set. Exceeding either limit can also generate  $\overline{\text{SMBALERT}}$  interrupts.

**Table 5. 2.5 V Limits Registers**

Register	Description	Default
0x44	2.5 V low limit	0x00
0x45	2.5 V high limit	0xFF
0x48	$V_{CC}$ low limit	0x00
0x49	$V_{CC}$ high limit	0xFF

**Figure 23. Structure of Analog Inputs**

Table 6 shows the input ranges of the analog inputs and output codes of the 10-bit ADC.

When the ADC is running, it samples and converts a voltage input in 711  $\mu\text{s}$  and averages 16 conversions to reduce noise; a measurement takes nominally 11.38 ms.

1. The  $V_{CC}$  output codes listed assume that  $V_{CC}$  is 3.3 V. If  $V_{CC}$  input is reconfigured for 5.0 V operation (by setting Bit 7 of Configuration Register 1), the  $V_{CC}$  output codes are the same as for the 5.0  $V_{IN}$  column.

### Additional ADC Functions for Voltage Measurements

A number of other functions are available on the ADT7460 to offer the systems designer increased flexibility.

#### Turn-Off Averaging

For each voltage measurement read from a value register, 16 readings have actually been made internally and the results averaged before being placed into the value register. If the user wants to speed up conversion, setting Bit 4 of

Configuration Register 2 (Reg. 0x73) turns averaging off. This effectively gives a reading 16 times faster (711  $\mu$ s), but the reading may be noisier.

#### Bypass Voltage Input Attenuator

Setting Bit 5 of Configuration Register 2 (Reg. 0x73) removes the attenuation circuitry from the 2.5 V input. This allows the user to directly connect external sensors or to rescale the analog voltage measurement inputs for other

applications. The input range of the ADC without the attenuators is 0 V to 2.25 V.

**Single-Channel ADC Conversion**

Setting Bit 6 of Configuration Register 2 (Reg. 0x73) places the ADT7460 into single-channel ADC conversion mode. In this mode, the ADT7460 can be made to read a single voltage channel only. If the internal ADT7460 clock is used, the selected input is read every 711  $\mu$ s. The appropriate ADC channel is selected by writing to Bits <7:5> of the TACH1 Minimum High Byte register (Reg. 0x55).

**Table 7. Configuration Register 2 (Reg. 0x73)**

**Temperature Measurement System**

**Local Temperature Measurement**

The ADT7460 contains an on-chip band gap temperature sensor whose output is digitized by the on-chip 10-bit ADC. The 8-bit MSB temperature data is stored in the local temperature register (Address 0x26). As both positive and

negative temperatures can be measured, the temperature data is stored in twos complement format, as shown in Table 9. Theoretically, the temperature sensor and ADC can measure temperatures from -128°C to +127°C with a resolution of 0.25°C. However, this exceeds the operating temperature range of the device, so local temperature measurements outside this range are not possible.

**Remote Temperature Measurement**

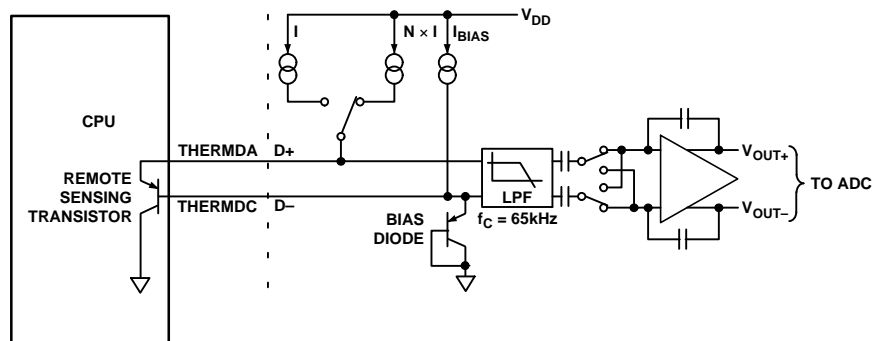

The ADT7460 can measure the temperature of two remote diode sensors or diode-connected transistors connected to Pins 12 and 13, or Pins 10 and 11.

The forward voltage of a diode or diode-connected transistor operated at a constant current exhibits a negative temperature coefficient of about -2 mV/°C. Unfortunately, the absolute value of V<sub>BE</sub> varies from device to device, and individual calibration is required to null this out, so the technique is unsuitable for mass production. The technique used in the ADT7460 is to measure the change in V<sub>BE</sub> when the device is operated at two different currents. This is given by:

where:

- K is Boltzmann's constant.
- q is the charge on the carrier.
- T is the absolute temperature in Kelvins.
- N is the ratio of the two currents.

Figure 24 shows the input signal conditioning used to measure the output of a remote temperature sensor. This figure shows the external sensor as a substrate transistor provided for temperature monitoring on some microprocessors. It could equally well be a discrete transistor, such as a 2N3904.

**Figure 24. Signal Conditioning for Remote Diode Temperature Sensors**

If a discrete transistor is used, the collector is not grounded, and it should be linked to the base. If a PNP transistor is used, the base is connected to the D- input and the emitter to the D+ input. If an NPN transistor is used, the emitter is connected to the D- input, and the base to the D+ input. Figure 25 and Figure 26 show how to connect the ADT7460 to an NPN or PNP transistor for temperature measurement. To prevent ground noise from interfering with the measurement, the more negative terminal of the

sensor is not referenced to ground but is biased above ground by an internal diode at the D- input.

To measure  $\Delta V_{BE}$ , the sensor is switched between operating currents of I and N x I. The resulting waveform is passed through a 65 kHz low-pass filter to remove noise and to a chopper stabilized amplifier that performs the functions of amplification and rectification of the waveform to produce a dc voltage proportional to  $\Delta V_{BE}$ . This voltage is measured by the ADC to give a temperature output in 10-bit,

twos complement format. To further reduce the effects of noise, digital filtering is performed by averaging the results of 16 measurement cycles. A remote temperature measurement takes nominally 25.5 ms. The results of remote temperature measurements are stored in 10-bit, twos complement format, as illustrated in Table 9. The extra resolution for the temperature measurements is held in the Extended Resolution Register 2 (Reg. 0x77). This gives temperature readings with a resolution of 0.25°C.

<5:4>	LTMP	Local temperature LSBs
<3:2>	TDM1	Remote 1 temperature LSBs

Reading Temperature from the ADT7460

It is important to note that temperature can be read from the ADT7460 as an 8-bit value (with 1°C resolution) or as a 10-bit value (with 0.25°C resolution). If only 1°C resolution is required, the temperature readings can be read back at any time and in no particular order.

If the 10-bit measurement is required, this involves a 2-register read for each measurement. The extended resolution register (Reg. 0x77) should be read first. This causes all temperature reading registers to be frozen until all temperature reading registers have been read from. This prevents an MSB reading from being updated while its two LSBs are being read, and vice versa.

Nulling Out Temperature Errors

As CPUs run faster, it becomes more difficult to avoid high frequency clocks when routing the D+, D- traces around a system board. Even when recommended layout guidelines are followed, there may still be temperature errors attributed to noise being coupled onto the D+/D- lines. High frequency noise generally has the effect of giving temperature measurements that are too high by a constant amount. The ADT7460 has temperature offset registers at Addresses 0x70, 0x72 for the Remote 1 and Remote 2 temperature channels. By doing a one-time calibration of the system, one can determine the offset caused by system board noise and null it out using the offset registers. The offset registers automatically add a twos complement 8-bit reading to every temperature measurement. The LSB adds 0.25°C offset to the temperature reading so the 8-bit register effectively allows temperature offsets of up to ±32°C with a resolution of 0.25°C. This ensures that the readings in the temperature measurement registers are as accurate as possible.

Table 12. Temperature Offset Registers

Register	Description	Default
0x70	Remote 1 temperature offset	0x00 (0°C)
0x71	Local temperature offset	0x00 (0°C)
0x72	Remote 2 temperature offset	0x00 (0°C)

Temperature Measurement Limit Registers

Associated with each temperature measurement channel are high and low limit registers. Exceeding the programmed high or low limit causes the appropriate status bit to be set. Exceeding either limit can also generate SMBALERT interrupts.

Table 13. Temperature Measurement Limit Registers

Register	Description	Default
0x4E	Remote 1 temperature low limit	0x81
0x4F	Remote 1 temperature high limit	0x7F
0x50	Local temperature low limit	0x81
0x51	Local temperature high limit	0x7F
0x52	Remote 2 temperature low limit	0x81
0x53	Remote 2 temperature high limit	0x7F

### Overtemperature Events

Overtemperature events on any of the temperature channels can be detected and dealt with automatically in automatic fan speed control mode. Registers 0x6A to 0x6C are the  $\overline{\text{THERM}}$  limits. When a temperature exceeds its  $\overline{\text{THERM}}$  limit, all fans run at 100% duty cycle. The fans continue running at 100% until the temperature drops below  $\overline{\text{THERM}}$  – Hysteresis. (This can be disabled by setting the BOOST bit in Configuration Register 3, Bit 2, Register 0x78). The hysteresis value for that  $\overline{\text{THERM}}$  limit is the value programmed into Registers 0x6D and 0x6E (hysteresis registers). The default hysteresis value is 4°C.

Figure 27.  $\overline{\text{THERM}}$  Limit Operation

### Additional ADC Functions for Temperature Measurement

A number of other functions are available on the ADT7460 to offer the systems designer increased flexibility.

### Turn-Off Averaging

For each temperature measurement read from a value register, 16 readings have actually been made internally and the results averaged before being placed into the value register. Sometimes it may be necessary to take a very fast measurement, for example, of CPU temperature. Setting Bit 4 of Configuration Register 2 (Reg. 0x73) turns averaging off. This takes a reading every 15.5 ms. Each remote temperature measurement takes 4 ms and the local temperature measurement takes 1.4 ms.

### Single-Channel ADC Conversions

Setting Bit 6 of Configuration Register 2 (Reg. 0x73) places the ADT7460 into single-channel ADC conversion mode. In this mode, the ADT7460 can be made to read a single temperature channel only. The appropriate ADC channel is selected by writing to Bits <7:5> of the TACH1 minimum high byte register (Reg. 0x55).

Table 14. Configuration Register 2 (Reg. 0x73)

Bit	Description
<4>	1: Averaging Off
<6>	1: Single-Channel Convert Mode

Table 15. TACH1 Minimum High Byte (Reg. 0x55)

Bit	Description	
<7:5>	Selects ADC channel for single-channel convert mode

	101	Remote 1 temp
	110	Local temp
	111	Remote 2 temp

### Limits, Status Registers, and Interrupts

#### Limit Values

Associated with each measurement channel on the ADT7460 are high and low limits. These can form the basis of system status monitoring: a status bit can be set for any out-of-limit condition and detected by polling the device. Alternatively,  $\overline{\text{SMBALERT}}$  interrupts can be generated to flag a processor or micro controller of out-of-limit conditions.

#### 8-Bit Limits

The following is a list of 8-bit limits on the ADT7460.

Table 16. Voltage Limit Registers

Register	Description	Default
0x44	2.5 V low limit	0x00
0x45	2.5 V high limit	0xFF
0x48	$V_{CC}$ low limit	0x00
0x49	$V_{CC}$ high limit	0xFF

Table 17. Temperature Limit Registers

Register	Description	Default
0x4E	Remote 1 temperature low limit	0x81
0x4F	Remote 1 temperature high limit	0x7F
0x6A	Remote 1 $\overline{\text{THERM}}$ limit	0x64
0x50	Local temperature low limit	0x81
0x51	Local temperature high limit	0x7F
0x6B	Local $\overline{\text{THERM}}$ limit	0x64
0x52	Remote 2 temperature low limit	0x81
0x53	Remote 2 temperature high limit	0x7F
0x6C	Remote 2 $\overline{\text{THERM}}$ limit	0x64

Table 18.  $\overline{\text{THERM}}$  Timer Limit Registers

Register	Description	Default
0x7A	$\overline{\text{THERM}}$ timer limit	0x00

**16-Bit Limits**

The fan TACH measurements are 16-bit results. The fan TACH limits are also 16 bits, consisting of a high byte and low byte. Since fans running under speed or stalled are normally the only conditions of interest, only high limits exist for fan TACHs. Since fan TACH period is actually being measured, exceeding the limit indicates a slow or stalled fan.

**Table 19. Fan Limit Registers**

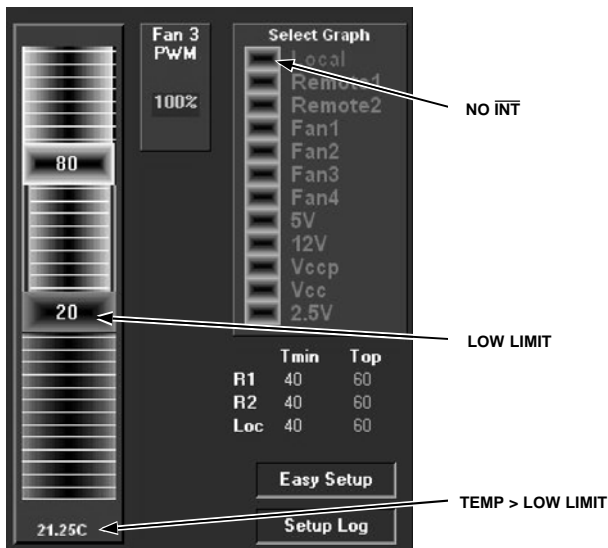

Register	Description	Default
0x54	TACH1 minimum low byte	0xFF
0x55	TACH1 minimum high byte	0xFF
0x56	TACH2 minimum low byte	0xFF
0x57	TACH2 minimum high byte	0xFF
0x58	TACH3 minimum low byte	0xFF
0x59	TACH3 minimum high byte	0xFF
0x5A	TACH4 minimum low byte	0xFF
0x5B	TACH4 minimum high byte	0xFF

**Out-of-Limit Comparisons**

Once all limits have been programmed, the ADT7460 can be enabled for monitoring. The ADT7460 measures all parameters in round-robin format and sets the appropriate status bit for out-of-limit conditions. Comparisons are done differently depending on whether the measured value is being compared to a high or low limit.

High limit: > comparison performed

Low limit: < or = comparison performed

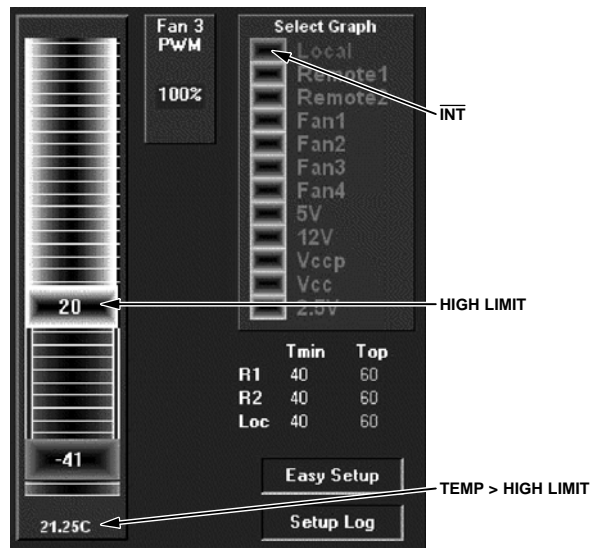

**Figure 28. Temperature > Low Limit: No INT**

**Figure 29. Temperature = Low Limit: INT Occurs**

**Figure 30. Temperature = High Limit: No INT**

**Figure 31. Temperature > High Limit: INT Occurs**

**Analog Monitoring Cycle Time**

The analog monitoring cycle begins when a 1 is written to the start bit (Bit 0) of Configuration Register 1 (Reg. 0x40). The ADC measures each analog input in turn and, as each measurement is completed, the result is automatically stored in the appropriate value register. This round-robin monitoring cycle continues unless disabled by writing a 0 to Bit 0 of Configuration Register 1.

As the ADC is normally allowed to free-run in this manner, the time taken to monitor all the analog inputs is normally not of interest, since the most recently measured value of any input can be read out at any time. For applications where the monitoring cycle time is important, it can easily be calculated.

The total number of channels measured is

- ◆ Two supply voltage inputs (2.5 V and V<sub>CC</sub>)
- ◆ Local temperature
- ◆ Two remote temperatures

As mentioned previously, the ADC performs round-robin conversions and takes 11.38 ms for each voltage measurement, 12 ms for a local temperature reading, and 25.5 ms for each remote temperature reading.

The total monitoring cycle time for averaged voltage and temperature monitoring is, therefore, nominally:

$$(2 \times 11.38) + 12 (2 \times 25.5) = 85.76 \text{ ms} \quad (\text{eq. 1})$$

The round robin starts again 35 ms later. Therefore, all channels are measured approximately every 120 ms.

Fan TACH measurements are made in parallel and are not synchronized with the analog measurements in any way.

**Status Registers**

The results of limit comparisons are stored in Status Registers 1 and 2. The status register bit for each channel reflects the status of the last measurement and limit comparison on that channel. If a measurement is within limits, the corresponding status register bit is cleared to 0. If the measurement is out-of-limits, the corresponding status register bit is set to 1.

The state of the various measurement channels may be polled by reading the status registers over the serial bus. In Bit 7 (OOL) of Status Register 1 (Reg. 0x41), 1 means that an out-of-limit event has been flagged in Status Register 2. This means that you need only read Status Register 2 when this bit is set. Alternatively, Pin 5 or Pin 14 can be configured as an  $\overline{\text{SMBALERT}}$  output. This automatically notifies the system supervisor of an out-of-limit condition. Reading the status registers clears the appropriate status bit as long as the error condition that caused the interrupt has cleared. Status register bits are “sticky.” Whenever a status bit is set, indicating an out-of-limit condition, it remains set even if the event that caused it has gone away (until read). The only way to clear the status bit is to read the status register after the event has gone away. Interrupt status mask registers (Reg. 0x74, 0x75) allow individual interrupt sources to be masked from causing an  $\overline{\text{SMBALERT}}$ . However, if one of these masked interrupt sources goes out-of-limit, its associated status bit is set in the interrupt status registers.

**Figure 32. Status Register 1**

**Table 20. Status Register 1 (Reg. 0x41)**

Bit	Mnemonic	Description
7	OOL	1 denotes a bit in Status Register 2 is set and Status Register 2 should be read.
6	R2T	1 indicates that the Remote 2 temperature high or low limit has been exceeded.
5	LT	1 indicates that the Local temperature high or low limit has been exceeded.
4	R1T	1 indicates that the Remote 1 temperature high or low limit has been exceeded.
3	–	Unused
2	VCC	1 indicates that the VCC high or low limit has been exceeded.
1	–	Unused
0	2.5 V	1 indicates that the 2.5 V high or low limit has been exceeded.

**Figure 33. Status Register 2**

**Table 21. Status Register 2 (Reg. 0x42)**

Bit	Mnemonic	Description
7	D2	1 indicates an open or short on D2+/D2– inputs.
6	D1	1 indicates an open or short on D2+/D2– inputs.
5	F4P	1 indicates that Fan 4 has dropped below minimum speed. Alternatively, indicates that THERM timer limit has been exceeded if the THERM timer function is used.
4	FAN3	1 indicates that Fan 3 has dropped below minimum speed.
3	FAN2	1 indicates that Fan 2 has dropped below minimum speed.
2	FAN1	1 indicates that Fan 1 has dropped below minimum speed.
1	OVT	1 indicates that a $\overline{\text{THERM}}$ overtemperature limit has been exceeded.
0	–	Unused

**SMBALERT Interrupt Behavior**

The ADT7460 can be polled for status, or an  $\overline{\text{SMBALERT}}$  interrupt can be generated for out-of-limit conditions. It is important to note how the  $\overline{\text{SMBALERT}}$  output and status bits behave when writing interrupt handler software.

Figure 34 shows how the  $\overline{\text{SMBALERT}}$  output and sticky status bits behave. Once a limit is exceeded, the corresponding status bit is set to 1. The status bit remains set until the error condition subsides and the status register is read. The status bits are referred to as sticky since they remain set until read by software. This ensures that an out-of-limit event cannot be missed if software is polling the device periodically. Note that the  $\overline{\text{SMBALERT}}$  output remains low for the entire duration that a reading is out-of-limit and until the status register has been read. This has implications on how software handles the interrupt.

**Figure 34. SMBALERT and Status Bit Behavior**

**Handling SMBALERT Interrupts**

To prevent the system from being tied up servicing interrupts, it is recommend to handle the  $\overline{\text{SMBALERT}}$  interrupt as follows:

1. Detect the  $\overline{\text{SMBALERT}}$  assertion.
2. Enter the interrupt handler.
3. Read the status registers to identify the interrupt source.
4. Mask the interrupt source by setting the appropriate mask bit in the interrupt mask registers (Reg. 0x74, 0x75).
5. Take the appropriate action for a given interrupt source.
6. Exit the interrupt handler.
7. Periodically poll the status registers. If the interrupt status bit has cleared, reset the corresponding interrupt mask bit to 0. This causes the  $\overline{\text{SMBALERT}}$  output and status bits to behave as shown in Figure 35.

**Figure 35. How Masking the Interrupt Source Affects SMBALERT Output**

**Masking Interrupt Sources**

Interrupt Mask Registers 1 and 2 are located at Addresses 0x74 and 0x75. These allow individual interrupt sources to be masked out to prevent  $\overline{\text{SMBALERT}}$  interrupts. Note that masking an interrupt source prevents only the  $\overline{\text{SMBALERT}}$  output from being asserted; the appropriate status bit is set as normal.

**Table 22. Interrupt Mask Register 1 (Reg. 0x74)**

Bit	Mnemonic	Description
7	OOL	1 masks $\overline{\text{SMBALERT}}$ for any alert condition flagged in Status Register 2.
6	R2T	1 masks $\overline{\text{SMBALERT}}$ for Remote 2 temperature.
5	LT	1 masks $\overline{\text{SMBALERT}}$ for local temperature.
4	R1T	1 masks $\overline{\text{SMBALERT}}$ for Remote 1 temperature.
3	-	Unused
2	VCC	1 masks $\overline{\text{SMBALERT}}$ for the V <sub>CC</sub> channel.
1	-	Unused
0	2.5 V	1 masks $\overline{\text{SMBALERT}}$ for the 2.5 V channel.

**Table 23. Interrupt Mask Register 2 (Reg. 0x75)**

Bit	Mnemonic	Description
7	D2	1 masks $\overline{\text{SMBALERT}}$ for Diode 2 errors.
6	D1	1 masks $\overline{\text{SMBALERT}}$ for Diode 1 errors.
5	FAN4	1 masks $\overline{\text{SMBALERT}}$ for Fan 4 failure. If the TACH4 pin is being used as the THERM input, this bit masks $\overline{\text{SMBALERT}}$ for a THERM event.
4	FAN3	1 masks $\overline{\text{SMBALERT}}$ for Fan 3.
3	FAN2	1 masks $\overline{\text{SMBALERT}}$ for Fan 2.
2	FAN1	1 masks $\overline{\text{SMBALERT}}$ for Fan 1.
1	OVT	1 masks $\overline{\text{SMBALERT}}$ for overtemperature (exceeding THERM limits).
0	-	Unused

**Enabling the SMBALERT Interrupt Output**

The SMBALERT interrupt function is disabled by default. Pin 5 or Pin 14 can be reconfigured as an SMBALERT output to signal out-of-limit conditions.

**Table 24. Configuration Register 4 (Reg. 0x7D)**

Pin No.	Bit Setting
14	<0> AL2.5V = 1

**Table 25. Configuration Register 3 (Reg. 0x78)**

Pin No.	Bit Setting
5	<0> ALERT = 1

**To Assign THERM Functionality to Pin 9**

Pin 9 can be configured as the THERM pin on the ADT7460. To configure Pin 9 as the THERM pin, set the THERM ENABLE Bit (Bit 1) in Configuration Register 3 (Address 0x78) = 1.

**THERM as an Input**

When configured as an input, the THERM pin allows the user to time assertions on the pin. This can be useful for connecting to the PROCHOT output of a CPU to gauge system performance. For more information on timing THERM assertions and generating SMBALERTs based on THERM, see the Generating Interrupts from Events sections.

The user can also set up the ADT7460 so when the THERM pin is driven low externally, the fans run at 100%. The fans run at 100% while the THERM pin is pulled low.

This is done by setting the BOOST bit (Bit 2) in Configuration Register 3 (Address 0x78) to 1. This works only if the fan is already running, for example, in manual mode when the current duty cycle is above 0x00 or in automatic mode when the temperature is above T<sub>MIN</sub>. If the temperature is below T<sub>MIN</sub> or if the duty cycle in manual mode is set to 0x00, pulling THERM low externally has no effect. See Figure 36 for more information.

**Figure 36. Asserting THERM Low as an Input in Automatic Fan Speed Control Mode**

**THERM Timer**

The ADT7460 has an internal timer to measure THERM assertion time. For example, the THERM input may be connected to the PROCHOT output of a Pentium 4 CPU and measure system performance. The THERM input may also be connected to the output of a trip point temperature sensor.

The timer is started on the assertion of the ADT7460's THERM input and stopped on the negation of the pin. The timer counts THERM times cumulatively, therefore, the timer resumes counting on the next THERM assertion. The THERM timer continues to accumulate THERM assertion times until the timer is read (it is cleared on read) or until it reaches full scale. If the counter reaches full scale, it stops at that reading until cleared.

The 8-bit THERM timer register (Reg. 0x79) is designed such that Bit 0 is set to 1 on the first THERM assertion. Once the cumulative THERM assertion time exceeds 45.52 ms, Bit 1 of the THERM timer is set and Bit 0 becomes the LSB of the timer with a resolution of 22.76 ms.

Figure 37 illustrates how the THERM timer behaves as the THERM input is asserted and negated. Bit 0 is set on the first THERM assertion detected. This bit remains set until the cumulative THERM assertions exceed 45.52 ms. At this time, Bit 1 of the THERM timer is set, and Bit 0 is cleared. Bit 0 now reflects timer readings with a resolution of 22.76 ms.

**Figure 37. Understanding the THERM Timer**

When using the THERM timer, be aware of the following:

After a THERM timer read (Reg. 0x79)

- ♦ The contents of the timer is cleared on read.
- ♦ The F4P bit (Bit 5) of Status Register 2 needs to be cleared (assuming the THERM limit has been exceeded).

If the  $\overline{\text{THERM}}$  timer is read during a  $\overline{\text{THERM}}$  assertion

- ◆ The contents of the timer are cleared.
- ◆ Bit 0 of the  $\overline{\text{THERM}}$  timer is set to 1 (since a  $\overline{\text{THERM}}$  assertion is occurring).
- ◆ The  $\overline{\text{THERM}}$  timer increments from 0.
- ◆ If the  $\overline{\text{THERM}}$  limit (Reg. 0x7A) = 0x00, the F4P bit is set.

**Generating SMBALERT Interrupts from  $\overline{\text{THERM}}$  Events**

The ADT7460 can generate  $\overline{\text{SMBALERT}}$ s when a programmable  $\overline{\text{THERM}}$  limit has been exceeded. This allows the systems designer to ignore brief, infrequent  $\overline{\text{THERM}}$  assertions while capturing longer  $\overline{\text{THERM}}$  events. Register 0x7A is the  $\overline{\text{THERM}}$  limit register. This 8-bit register allows a limit from 0 seconds (first  $\overline{\text{THERM}}$

assertion) to 5.825 seconds to be set before an  $\overline{\text{SMBALERT}}$  is generated. The  $\overline{\text{THERM}}$  timer value is compared with the contents of the  $\overline{\text{THERM}}$  limit register. If the  $\overline{\text{THERM}}$  timer value exceeds the  $\overline{\text{THERM}}$  limit value, the F4P bit (Bit 5) of Status Register 2 is set and an  $\overline{\text{SMBALERT}}$  is generated. Note that the F4P bit (Bit 5) of Mask Register 2 (Reg. 0x75) masks out  $\overline{\text{SMBALERT}}$ s if this bit is set to 1, although the F4P bit of Interrupt Status Register 2 is still set if the  $\overline{\text{THERM}}$  limit is exceeded.

Figure 38 is a functional block diagram of the  $\overline{\text{THERM}}$  timer, limit, and associated circuitry. Writing 0x00 to the  $\overline{\text{THERM}}$  limit register (Reg. 0x7A) causes  $\overline{\text{SMBALERT}}$  to be generated on the first  $\overline{\text{THERM}}$  assertion. A  $\overline{\text{THERM}}$  limit of 0x01 generates an  $\overline{\text{SMBALERT}}$  once cumulative  $\overline{\text{THERM}}$  assertions exceed 45.52 ms.

**Figure 38. Functional Diagram of the ADT7460  $\overline{\text{THERM}}$  Monitoring Circuitry**

**Configuring the Desired  $\overline{\text{THERM}}$  Behavior**

1. Configure the  $\overline{\text{THERM}}$  input.  
Setting Bit 1 ( $\overline{\text{THERM}}$  ENABLE) of Configuration Register 3 (Reg. 0x78) enables the  $\overline{\text{THERM}}$  monitoring function.
2. Select the desired fan behavior for  $\overline{\text{THERM}}$  events.  
Setting Bit 2 (BOOST bit) of Configuration Register 3 (Reg. 0x78) causes all fans to run at 100% duty cycle whenever  $\overline{\text{THERM}}$  is asserted. This allows fail-safe system cooling. If this bit = 0, the fans run at their current settings and are not affected by  $\overline{\text{THERM}}$  events.
3. Select whether  $\overline{\text{THERM}}$  events should generate  $\overline{\text{SMBALERT}}$  interrupts.  
Bit 5 (F4P) of Mask Register 2 (Reg. 0x75), when set, masks out  $\overline{\text{SMBALERT}}$ s when the  $\overline{\text{THERM}}$  limit value is exceeded. This bit should be cleared

- if  $\overline{\text{SMBALERT}}$ s based on  $\overline{\text{THERM}}$  events are required.
4. Select a suitable  $\overline{\text{THERM}}$  limit value.  
This value determines whether an  $\overline{\text{SMBALERT}}$  is generated on the first  $\overline{\text{THERM}}$  assertion, or only if a cumulative  $\overline{\text{THERM}}$  assertion time limit is exceeded. A value of 0x00 causes an  $\overline{\text{SMBALERT}}$  to be generated on the first  $\overline{\text{THERM}}$  assertion.
5. Select a  $\overline{\text{THERM}}$  monitoring time.  
This is how often OS or BIOS level software checks the  $\overline{\text{THERM}}$  timer. For example, BIOS could read the  $\overline{\text{THERM}}$  timer once an hour to determine the cumulative  $\overline{\text{THERM}}$  assertion time. If, for example, the total  $\overline{\text{THERM}}$  assertion time is <22.76 ms in Hour 1, >182.08 ms in Hour 2, and >5.825 s in Hour 3, this can indicate that system performance is degrading significantly since

$\overline{\text{THERM}}$  is asserting more frequently on an hourly basis.

Alternatively, OS or BIOS level software can time-stamp when the system is powered on. If an  $\overline{\text{SMBALERT}}$  is generated due to the  $\overline{\text{THERM}}$  limit being exceeded, another time-stamp can be taken. The difference in time can be calculated for a fixed  $\overline{\text{THERM}}$  limit time. For example, if it takes one week for a  $\overline{\text{THERM}}$  limit of 2.914 s to be exceeded and the next time it takes only one hour, this indicates a serious degradation in system performance.

**Configuring the ADT7460  $\overline{\text{THERM}}$  Pin as an Output**

In addition to the ADT7460 being able to monitor  $\overline{\text{THERM}}$  as an input, the ADT7460 can optionally drive  $\overline{\text{THERM}}$  low as an output. The user can preprogram system critical thermal limits. If the temperature exceeds a thermal limit by 0.25°C,  $\overline{\text{THERM}}$  asserts low. If the temperature is still above the thermal limit on the next monitoring cycle,  $\overline{\text{THERM}}$  stays low.  $\overline{\text{THERM}}$  remains asserted low until the temperature is equal to or below the thermal limit. Since the temperature for that channel is measured only every monitoring cycle, once  $\overline{\text{THERM}}$  asserts, it is guaranteed to remain low for at least one monitoring cycle.

The  $\overline{\text{THERM}}$  pin can be configured to assert low if the Remote 1, local, or Remote 2 temperature  $\overline{\text{THERM}}$  limits are exceeded by 0.25°C. The  $\overline{\text{THERM}}$  limit registers are at Locations 0x6A, 0x6B, and 0x6C, respectively. Setting Bit 3 of Registers 0x5F, 0x60, and 0x61 enables the  $\overline{\text{THERM}}$  output feature for the Remote 1, local, and Remote 2 temperature channels, respectively. Figure 39 shows how the  $\overline{\text{THERM}}$  pin asserts low as an output in the event of a critical overtemperature.

**Figure 39. Asserting  $\overline{\text{THERM}}$  as an Output, Based on Tripping  $\overline{\text{THERM}}$  Limits**

**Fan Drive Using PWM Control**

The ADT7460 uses pulse width modulation (PWM) to control fan speed. This relies on varying the duty cycle (or

on/off ratio) of a square wave applied to the fan to vary the fan speed. The external circuitry required to drive a fan using PWM control is extremely simple. A single MOSFET is the only drive device required. The specifications of the MOSFET depend on the maximum current required by the fan being driven. Typical notebook fans draw a nominal 170 mA, so SOT devices can be used where board space is a concern. In desktops, fans can typically draw 250 mA to 300 mA each. If the user drives several fans in parallel from a single PWM output or drives larger server fans, the MOSFET needs to handle the higher current requirements. The only other stipulation is that the MOSFET should have a gate voltage drive,  $V_{GS} < 3.3$  V, for direct interfacing to the PWM\_OUT pin.  $V_{GS}$  can be greater than 3.3 V as long as the pullup on the gate is tied to 5.0 V. The MOSFET should also have a low on resistance to ensure that there is not significant voltage drop across the FET. This would reduce the voltage applied across the fan and, therefore, the maximum operating speed of the fan.

Figure 40 shows how a 3-wire fan can be driven using PWM control.

**Figure 40. Driving a 3-Wire Fan Using an N-Channel MOSFET**

Figure 40 uses a 10 kΩ pullup resistor for the TACH signal. This assumes that the TACH signal is open-collector from the fan. In all cases, the TACH signal from the fan must be kept below 5.0 V maximum to prevent damaging the ADT7460. If in doubt as to whether the fan used has an open-collector or totem pole TACH output, use one of the input signal conditioning circuits shown in the Fan Speed Measurement section.

Figure 41 shows a fan drive circuit using an NPN transistor such as a general-purpose MMBT2222. While these devices are inexpensive, they tend to have much lower current handling capabilities and higher on-resistance than MOSFETs. When choosing a transistor, care should be taken to ensure that it meets the fan's current requirements.

Ensure that the base resistor is chosen such that the transistor is saturated when the fan is powered on.

Figure 41. Driving a 3-Wire Fan Using an NPN Transistor

**Driving Two Fans from PWM3**

Note that the ADT7460 has four TACH inputs available for fan speed measurement, but only three PWM drive outputs. If a fourth fan is being used in the system, it should be driven from the PWM3 output in parallel with the third fan. Figure 42 shows how to drive two fans in parallel using low cost NPN transistors. Figure 43 is the equivalent circuit using the NDT3055L MOSFET. Note that since the MOSFET can handle up to 3.5 A, it is simply a matter of connecting another fan directly in parallel with the first.

Care should be taken in designing drive circuits with transistors and FETs to ensure that the PWM pins are not required to source current and that they sink less than the 8 mA maximum current specified on the data sheet.

**Driving Up to Three Fans from PWM2**

TACH measurements for fans are synchronized to particular PWM channels, for example, TACH1 is synchronized to PWM1. TACH3 and TACH4 are both synchronized to PWM3, so PWM3 can drive two fans. Alternatively, PWM3 can be programmed to synchronize TACH2, TACH3, and TACH4 to the PWM3 output. This allows PWM3 to drive two or three fans. In this case, the drive circuitry looks the same as shown in Figure 41, Figure 42, and Figure 43. The SYNC bit in Register 0x62 enables this function.

Figure 42. Interfacing Two Fans in Parallel to the PWM3 Output Using Low Cost NPN Transistors

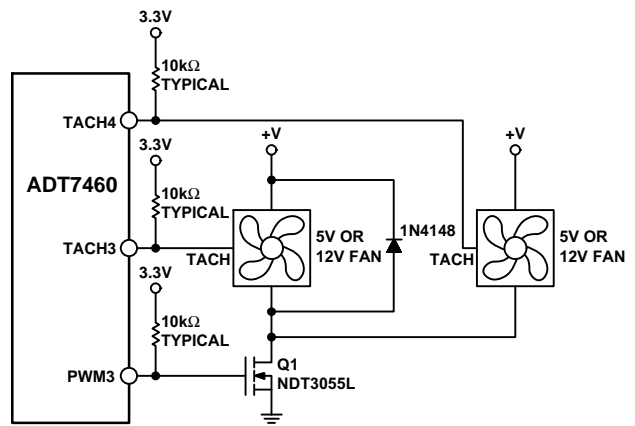

Figure 43. Interfacing Two Fans in Parallel to the PWM3 Output Using a Single N-Channel MOSFET

Table 26. SYNC: Enhance Acoustics Register 1 (Reg. 0x62)

Bit	Mnemonic	Description
<4>	SYNC	1 synchronizes TACH2, TACH3, and TACH4 to PWM3.

**Driving 2-Wire Fans**

Figure 44 shows how a 2-wire fan may be connected to the ADT7460. This circuit allows the speed of a 2-wire fan to be measured, even though the fan has no dedicated TACH signal. A series resistor,  $R_{SENSE}$ , in the fan circuit converts the fan commutation pulses into a voltage. This is ac-coupled into the ADT7460 through the 0.01  $\mu$ F capacitor. On-chip signal conditioning allows accurate monitoring of fan speed. The value of  $R_{SENSE}$  chosen depends on the programmed input threshold and on the current drawn by the fan. For fans drawing approximately 200 mA, a 2  $\Omega$   $R_{SENSE}$  value is suitable when the threshold is programmed as 40 mV. For fans that draw more current, such as larger desktop or server fans,  $R_{SENSE}$  may be reduced for the same programmed threshold. The smaller the threshold programmed the better, since more voltage is developed across the fan and the fan spins faster. Figure 45 shows a typical plot of the sensing waveform at a TACH/AIN pin. The most important thing is that the voltage spikes (either negative going or positive going) are more than 40 mV in amplitude. This allows fan speed to be reliably determined.

Figure 44. Driving a 2-Wire Fan

Figure 45. Fan Speed Sensing Waveform at TACH/AIN Pin

Laying Out 2-Wire and 3-Wire Fans

Figure 46 shows how to lay out a common circuit arrangement for 2-wire and 3-wire fans. Some components are not populated, depending on whether a 2-wire or 3-wire fan is used.

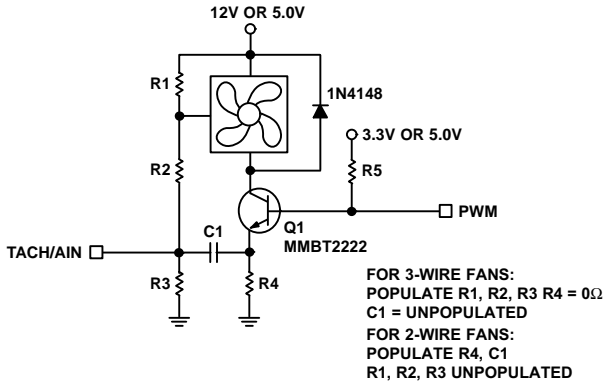

Figure 46. Planning for 2-Wire or 3-Wire Fans on a PCB

TACH Inputs

Pins 4, 6, 7, and 9 are open-drain TACH inputs for fan speed measurement.

Signal conditioning in the ADT7460 accommodates the slow rise and fall times typical of fan tachometer outputs. The maximum input signal range is 0 V to 5.0 V, even where V<sub>CC</sub> is less than 5.0 V. In the event that these inputs are supplied from fan outputs that exceed 0 V to 5.0 V, either resistive attenuation of the fan signal or diode clamping must be included to keep inputs within an acceptable range.

Figure 47 to Figure 50 show circuits for most common fan TACH outputs.

If the fan TACH output has a resistive pullup to V<sub>CC</sub>, it can be connected directly to the fan input, as shown in Figure 47.

Figure 47. Fan with TACH Pullup to V<sub>CC</sub>

If the fan output has a resistive pullup to 12 V (or other voltage greater than 5.0 V), the fan output can be clamped with a Zener diode, as shown in Figure 48. The Zener diode voltage should be greater than V<sub>IH</sub> of the TACH input but less than 5.0 V, allowing for the voltage tolerance of the Zener. A value of between 3 V and 5.0 V is suitable.

Figure 48. Fan with TACH Pullup to Voltage . 5.0 V, for Example, 12 V, Clamped with Zener Diode

If the fan has a strong pullup (less than 1 kΩ) to 12 V or a totem-pole output, a series resistor can be added to limit the Zener current, as shown in Figure 49. Alternatively, a resistive attenuator may be used, as shown in Figure 50. R1 and R2 should be chosen such that:

$$2 V < V_{PULLUP} \times R2 / (R_{PULLUP} + R1 + R2) < 5.0 V$$

The fan inputs have an input resistance of nominally 160 kΩ to ground. This should be taken into account when calculating resistor values.

With a pullup voltage of 12 V and pullup resistor less than 1 kΩ, suitable values for R1 and R2 would be 100 kΩ and 47 kΩ. This gives a high input voltage of 3.83 V.

Figure 49. Fan with Strong TACH Pullup to > V<sub>CC</sub> or Totem-Pole Output, Clamped with Zener and Resistor

**Figure 50. Fan with Strong TACH Pullup to > V<sub>CC</sub> or Totem-Pole Output, Attenuated with R1/R2**

**Fan Speed Measurement**

The fan counter does not count the fan TACH output pulses directly because the fan speed may be less than 1000 RPM. It would take several seconds to accumulate a reasonably large and accurate count. Instead, the period of the fan revolution is measured by gating an on-chip 90 kHz oscillator into the input of a 16-bit counter for N periods of the fan TACH output (Figure 51). The accumulated count is actually proportional to the fan tachometer period and inversely proportional to the fan speed.

**Figure 51. Fan Speed Measurement**

N, the number of pulses counted, is determined by the settings of Register 0x7B (fan pulses per revolution register). This register contains two bits for each fan, allowing one, two (default), three, or four TACH pulses to be counted.

The fan tachometer readings are 16-bit values consisting of a 2-byte read from the ADT7460.

**Table 27. Fan Speed Measurement Registers**

Register	Description	Default
0x28	TACH1 low byte	0x00
0x29	TACH1 high byte	0x00
0x2A	TACH2 low byte	0x00
0x2B	TACH2 high byte	0x00
0x2C	TACH3 low byte	0x00
0x2D	TACH3 high byte	0x00
0x2E	TACH4 Low byte	0x00
0x2F	TACH4 high byte	0x00

**Reading Fan Speed from the ADT7460**

If fan speeds are being measured, this involves a 2-register read for each measurement. The low byte should be read first. This causes the high byte to be frozen until both

high and low byte registers are read from. This prevents erroneous TACH readings.

The fan tachometer reading registers report the number of 11.11 μs period clocks (90 kHz oscillator) gated to the fan speed counter, from the rising edge of the first fan TACH pulse to the rising edge of the third fan TACH pulse (assuming two pulses per revolution are being counted). Since the device is essentially measuring the fan TACH period, the higher the count value the slower the fan is actually running. A 16-bit fan tachometer reading of 0xFFFF indicates either that the fan has stalled or that it is running very slowly (<100 RPM).

**High Limit: > Comparison Performed**

Since the actual fan TACH period is being measured, exceeding a fan TACH limit by 1 sets the appropriate status bit and can be used to generate an SMBALERT. The fan TACH limit registers are 16-bit values consisting of two bytes.

**Table 28. Fan TACH Limit Registers**

Register	Description	Default
0x54	TACH1 minimum low byte	0xFF
0x55	TACH1 minimum high byte	0xFF
0x56	TACH2 minimum low byte	0xFF
0x57	TACH2 minimum high byte	0xFF
0x58	TACH3 minimum low byte	0xFF
0x59	TACH3 minimum high byte	0xFF
0x5A	TACH4 minimum low byte	0xFF
0x5B	TACH4 minimum high byte	0xFF

**Fan Speed Measurement Rate**

The fan TACH readings are normally updated once every second.

The FAST bit (Bit 3) of Configuration Register 3 (Reg. 0x78), when set, updates the fan TACH readings every 250 ms.

If any of the fans are not being driven by a PWM channel but are instead powered directly from 5.0 V or 12 V, its associated dc bit in Configuration Register 3 should be set. This allows TACH readings to be taken on a continuous basis for fans connected directly to a dc source.

**Calculating Fan Speed**

Assuming a fan with a two pulses/revolution (and two pulses/ revolution being measured), fan speed is calculated by:

$$\text{Fan Speed (RPM)} = 90,000 \times 60 / \text{Fan TACH Reading}$$

where:

$$\text{Fan TACH Reading} = 16\text{-Bit Fan Tachometer Reading}$$

For example:

$$\text{TACH1 High Byte (Reg. 0x29)} = 0x17$$

$$\text{TACH1 Low Byte (Reg. 0x28)} = 0xFF$$

What is Fan 1 speed in RPM?

$$\text{Fan 1 TACH Reading} = 0x17FF = 6143d$$

$$\text{RPM} = (f \times 60) / \text{Fan 1 TACH Reading}$$

$$\text{RPM} = (90000 \times 60) / 6143$$

$$\text{Fan Speed} = 879 \text{ RPM}$$

### Fan Pulses per Revolution

Different fan models can output either 1, 2, 3, or 4 TACH pulses per revolution. Once the number of fan TACH pulses is determined, it can be programmed into the fan pulses per revolution register (Reg. 0x7B) for each fan. Alternatively, this register can be used to determine the number of pulses/revolution output by a given fan. By plotting fan speed measurements at 100% speed with different pulses/revolution settings, the smoothest graph with the lowest ripple determines the correct pulses/revolution value.

**Table 29. Fan Pulses/Revolution Register (Reg. 0x7B)**

Bit	Mnemonic	Description
<1:0>	FAN1 Default	2 pulses per revolution
<3:2>	FAN2 Default	2 pulses per revolution
<5:4>	FAN3 Default	2 pulses per revolution
<7:6>	FAN4 Default	2 pulses per revolution

**Table 30. Fan Pulses/Revolution Register Bit Values**

Value	Description
00	1 pulse per revolution
01	2 pulses per revolution
10	3 pulses per revolution
11	4 pulses per revolution

### 2-Wire Fan Speed Measurements

The ADT7460 is capable of measuring the speed of 2-wire fans, that is, fans without TACH outputs. To do this, the fan must be interfaced as shown in the Fan Drive Circuitry section. In this case, the TACH inputs need to be reprogrammed as analog inputs, AIN.

**Table 31. Configuration Register 2 (Reg. 0x73)**

Bit	Mnemonic	Description
3	AIN4	1 indicates that Pin 9 is reconfigured to measure the speed of a 2-wire fan using an external sensing resistor and coupling capacitor.
2	AIN3	1 indicates that Pin 4 is reconfigured to measure the speed of a 2-wire fan using an external sensing resistor and coupling capacitor.
1	AIN2	1 indicates that Pin 7 is reconfigured to measure the speed of a 2-wire fan using an external sensing resistor and coupling capacitor.
0	AIN1	1 indicates that Pin 6 is reconfigured to measure the speed of a 2-wire fan using an external sensing resistor and coupling capacitor.

### AIN Switching Threshold

Having configured the TACH inputs as AIN inputs for 2-wire measurements, the user can select the sensing threshold for the AIN signal.

**Table 32. Configuration Register 4 (Reg. 0x7D)**

Bit	Mnemonic	Description
<3:2>	AINL	These two bits define the input threshold for 2-wire fan speed measurements. 00 = $\pm 20$ mV 01 = $\pm 40$ mV 10 = $\pm 80$ mV 11 = $\pm 130$ mV

### Fan Spin-Up

The ADT7460 has a unique fan spin-up function. It spins the fan at 100% PWM duty cycle until two TACH pulses are detected on the TACH input. Once two pulses are detected, the PWM duty cycle goes to the expected running value, for example, 33%. The advantage of this is that fans have different spin-up characteristics and take different amounts of time to overcome inertia. The ADT7460 runs the fans just fast enough to overcome inertia and is quieter on spin-up than fans programmed to spinup for a given spin-up time.

### Fan Startup Timeout

To prevent false interrupts being generated as a fan spins up (since it is below running speed), the ADT7460 includes a fan startup timeout function. This is the time limit allowed for two TACH pulses to be detected on spin-up. For example, if 2 seconds fan startup timeout is chosen and no TACH pulses occur within 2 seconds of the start of spin-up, a fan fault is detected and flagged in the interrupt status registers.

**Table 33. PWM1 to PWM3 Configuration (Reg. 0x5C to 0x5E)**

Bit	Mnemonic	Description
<2:0>	SPIN	These bits control the startup timeout for PWM1. 000 = no startup timeout 001 = 100 ms 010 = 250 ms (default) 011 = 400 ms 100 = 667 ms 101 = 1 s 110 = 2 s 111 = 4 s

### Disabling Fan Startup Timeout

Although fan startup makes fan spin-ups much quieter than fixed-time spin-ups, the option exists to use fixed spin-up times. Bit 5 (FSPDIS) = 1 in Configuration Register 1 (Reg. 0x40) disables the spin-up for two TACH pulses. Instead, the fan spins up for the fixed time as selected in Registers 0x5C to 0x5E.

### PWM Logic State

The PWM outputs can be programmed high for 100% duty cycle (non-inverted) or low for 100% duty cycle (inverted).

**Table 34. PWM1 to PWM3 Configuration (Reg. 0x5C to 0x5E) Bits**

Bit	Mnemonic	Description
<4>	INV	0 = logic high for 100% PWM duty cycle 1 = logic low for 100% PWM duty cycle

**PWM Drive Frequency**

The PWM drive frequency can be adjusted for the application. Registers 0x5F to 0x61 configure the PWM frequency for PWM1 to PWM3, respectively.

**Table 35. PWM1 to PWM3 Frequency Registers (Reg. 0x5F to 0x61)**

Bit	Mnemonic	Description
<2:0>	FREQ	000 = 11.0 Hz 001 = 14.7 Hz 010 = 22.1 Hz 011 = 29.4 Hz 100 = 35.3 Hz (default) 101 = 44.1 Hz 110 = 58.8 Hz 111 = 88.2 Hz

**Fan Speed Control**

The ADT7460 can control fan speed by two different modes. The first is automatic fan speed control mode. In this mode, fan speed is automatically varied with temperature and without CPU intervention, once initial parameters are set up. The advantage of this is that, in the case of the system hanging, the system is protected from overheating. The automatic fan speed control incorporates a feature called dynamic T<sub>MIN</sub> calibration. This feature reduces the design effort required to program the automatic fan speed control loop. For more information on how to program the automatic fan speed control loop and dynamic T<sub>MIN</sub> calibration, see AN613/D, the Programming the Automatic Fan Speed Control Loop Application Note.

The second fan speed control method is manual fan speed control, which is described next.

**Manual Fan Speed Control**

The ADT7460 allows the duty cycle of any PWM output to be manually adjusted. This can be useful if you want to change fan speed in software or if you want to adjust PWM duty cycle output for test purposes. Bits <7:5> of Registers 0x5C, 0x5E (PWM configuration) control the behavior of each PWM output.

**Table 36. PWM1 to PWM3 Configuration (Reg. 0x5C to 0x5E) Bits**

Bit	Mnemonic	Description
<7:5>	BHVR 111	Manual mode

Once under manual control, each PWM output can be manually updated by writing to Registers 0x30, 0x32 (PWMx current duty cycle registers).

**Figure 52. Control PWM Duty Cycle Manually with a Resolution of 0.39%**

**Programming the PWM Current Duty Cycle Registers**

The PWM current duty cycle registers are 8-bit registers, which allow the PWM duty cycle for each output to be set anywhere from 0% (0x00) to 100% (0xFF) in steps of 0.39% (256 steps).

The value to be programmed into the PWMMIN register is given by:

$$\text{Value (decimal)} = \text{PWM}_{\text{MIN}}/0.39$$

Example 1: For a PWM duty cycle of 50%,

$$\text{Value (decimal)} = 50/0.39 = 128d$$

$$\text{Value} = 128d \text{ or } 0x80.$$

Example 2: For a PWM duty cycle of 33%,

$$\text{Value (decimal)} = 33/0.39 = 85d$$

$$\text{Value} = 85d \text{ or } 0x54.$$

**Table 37. PWM Duty Cycle Registers**

Register	Description	Default
0x30	PWM1 duty cycle	0xFF (100%)
0x31	PWM2 duty cycle	0xFF (100%)
0x32	PWM3 duty cycle	0xFF (100%)

By reading the PWMx current duty cycle registers, users can keep track of the current duty cycle on each PWM output, even when the fans are running in automatic fan speed control mode or in acoustic enhancement mode.

**Operating from 3.3 V Standby**

The ADT7460 has been specifically designed to operate from a 3.3 V STBY supply. In computers that support S3 and S5 states, the core voltage of the processor is lowered in these states. If using the dynamic T<sub>MIN</sub> mode, lowering the core voltage of the processor would change the CPU temperature and change the dynamics of the system under dynamic T<sub>MIN</sub> control. Likewise, when monitoring THERM, the THERM timer should be disabled during these states.

# ADT7460

## XNOR Tree Test Mode

The ADT7460 includes an XNOR tree test mode. This mode is useful for in-circuit test equipment at board-level testing. By applying stimulus to the pins included in the XNOR tree, it is possible to detect opens or shorts on the system board. Figure 53 shows the signals that are exercised in the XNOR tree test mode.

The XNOR tree test is invoked by setting Bit 0 (XEN) of the XNOR tree test enable register (Reg. 0x6F).

Figure 53. XNOR Tree Test

## Power-On Default

The ADT7460 does not monitor temperature and fan speed by default on powerup. Monitoring of temperature and fan speed is enabled by setting the start bit in configuration Register 1 (Bit 0, Address 0x40) to 1. The fans run at full speed on powerup. This is because the BHVR bits (Bits <7:5>) in the PWMx configuration registers are set to 100 (fans run full speed) by default.

**Table 39. Voltage Reading Registers (Power-On Default = 0x00) (Note 1)**

Register Address	R/W	Description
0x20	Read-only	2.5 V Reading (8 MSBs of reading)
0x22	Read-only	V <sub>CC</sub> Reading: Measures V <sub>CC</sub> through the V <sub>CC</sub> pin (8 MSBs of reading)

1. These voltage readings are in two's complement format. If the extended resolution bits of these readings are also being read, the extended resolution registers (Reg. 0x76, 0x77) should be read first. Once the extended resolution registers are read, the associated MSB reading registers are frozen until read. Both the extended resolution registers and the MSB registers are frozen.

**Table 40. Temperature Reading Registers (Power-On Default = 0x80) (Note 1)**

Register Address	R/W	Description
0x25	Read-only	Remote 1 temperature reading-PP(8 MSBs of reading). (Note 2)
0x26	Read-only	Local temperature reading (8 MSBs of reading).
0x27	Read-only	Remote 2 temperature reading (8 MSBs of reading).

1. These voltage readings are in two's complement format.
2. Note that a reading of 0x80 in a temperature reading register indicates a diode fault (open or short) on that channel. If the extended resolution bits of these readings are also being read, the extended resolution registers (Reg. 0x76, 0x77) should be read first. Once the extended resolution registers are read, the associated MSB reading registers are frozen until read. Both the extended resolution registers and the MSB registers are frozen.

# ADT7460

**Table 41. Fan Tachometer Reading Registers (Power-On Default = 0x00)** (Note 1)

Register Address	R/W	Description
0x28	Read-only	TACH1 low byte.
0x29	Read-only	TACH1 high byte.
0x2A	Read-only	TACH2 low byte.
0x2B	Read-only	TACH2 high byte.
0x2C	Read-only	TACH3 low byte.
0x2D	Read-only	TACH3 high byte.
0x2E	Read-only	TACH4 low byte.
0x2F	Read-only	TACH4 high byte.

1. The Fan Tachometer Reading registers count the number of 11.11  $\mu$ s periods (based on an internal 90 kHz clock) that occur between a number of consecutive fan TACH pulses (default = 2). The number of TACH pulses used to count can be changed using the fan pulses per revolution register (Reg. 0x7B). This allows the fan speed to be accurately measured. Since a valid fan tachometer reading requires that two bytes are read, the low byte MUST be read first. Both the low and high bytes are then frozen until read. At power-on, these registers contain 0x0000 until such time as the first valid fan TACH measurement is read in to these registers. This prevents false interrupts from occurring while the fans are spinning up.

A count of 0xFFFF indicates that a fan is:

- Stalled or blocked (object jamming the fan).
- Failed (internal circuitry destroyed).
- Not populated. (The ADT7460 expects to see a fan connected to each TACH. If a fan is not connected to that TACH, its TACH minimum high and low byte should be set to 0xFFFF.)
- Alternate function, for example, TACH4 reconfigured as a  $\overline{\text{THERM}}$  pin.
- 2-Wire Instead of 3-Wire Fan

**Table 42. Current PWM Duty Cycle Registers (Power-On Default = 0xFF)** (Note 1)

Register Address	R/W	Description
0x30	R/W	PWM1 current duty cycle (0% to 100% duty cycle = 0x00 to 0xFF).
0x31	R/W	PWM2 current duty cycle (0% to 100% duty cycle = 0x00 to 0xFF).
0x32	R/W	PWM3 current duty cycle (0% to 100% duty cycle = 0x00 to 0xFF).

1. These registers reflect the PWM duty cycle driving each fan at any given time. When in automatic fan speed control mode, the ADT7460 reports the PWM duty cycles back through these registers. The PWM duty cycle values vary according to temperature in automatic fan speed control mode. During fan startup, these registers report back 0x00. In software mode, the PWM duty cycle outputs can be set to any duty cycle value by writing to these registers.

**Table 43. Operating Point Registers (Power-On Default = 0x64)** (Note 1)

Register Address	R/W	Description
0x33	R/W	Remote 1 Operating Point Register (Default = 100°C)
0x34	R/W	Local Temp Operating Point Register (Default = 100°C)
0x35	R/W	Remote 2 Operating Point Register (Default = 100°C)

1. These registers become read-only when the Configuration Register 1 lock bit is set to 1. Any subsequent attempts to write to these registers will fail. These registers set the target operating point for each temperature channel when the dynamic  $T_{\text{MIN}}$  control feature is enabled. The fans being controlled are adjusted to maintain temperature about an operating point.

Table 44. Register 0x36 — Dynamic T<sub>MIN</sub> Control Register 1 (Power-On Default = 0x00) (Note 1)

Bit No.	Mnemonic	R/W	Description
<0>	CYR2	R/W	MSB of 3-Bit Remote 2 Cycle Value. The other two bits of the code reside in Dynamic T <sub>MIN</sub> Control Register 2 (Reg. 0x37). These three bits define the delay time between making subsequent T <sub>MIN</sub> adjustments in the control loop, in terms of number of monitoring cycles. The system has associated thermal time constants that need to be found to optimize the response of fans and the control loop.
<1>	Reserved	Read-only	Reserved for future use.
<2>	PHTR1	R/W	PHTR1 = 1 copies the Remote 1 current temperature to the Remote 1 operating point register if THERM is asserted. The operating point contains the temperature at which THERM is asserted. This allows the system to run as quietly as possible without affecting system performance. PHTR1 = 0 ignores any THERM assertions on the THERM pin. The Remote 1 operating point register reflects its programmed value.
<3>	PHTL	R/W	PHTL = 1 copies the local channel's current temperature to the local operating point register if THERM is asserted. The operating point contains the temperature at which THERM is asserted. This allows the system to run as quietly as possible without affecting system performance. PHTL = 0 ignores any THERM assertions on the THERM pin. The local temperature operating point register reflects its programmed value.
<4>	PHTR2	R/W	PHTR2 = 1 copies the Remote 2 current temperature to the Remote 2 operating point register if THERM is asserted. The operating point contains the temperature at which THERM is asserted. This allows the system to run as quietly as possible without system performance being affected. PHTR2 = 0 ignores any THERM assertions on the THERM pin. The Remote 2 operating point register reflects its programmed value.
<5>	R1T	R/W	R1T = 1 enables dynamic T <sub>MIN</sub> control on the Remote 1 temperature channel. The chosen T <sub>MIN</sub> value is dynamically adjusted based on the current temperature, operating point, and high and low limits for this zone. R1T = 0 disables dynamic T <sub>MIN</sub> control. The T <sub>MIN</sub> value chosen is not adjusted, and the channel behaves as described in the Automatic Fan Control section.
<6>	LT	R/W	LT = 1 enables dynamic T <sub>MIN</sub> control on the local temperature channel. The chosen T <sub>MIN</sub> value is dynamically adjusted based on the current temperature, operating point, and high and low limits for this zone. LT = 0 disables dynamic T <sub>MIN</sub> control. The T <sub>MIN</sub> value chosen is not adjusted, and the channel behaves as described in the Automatic Fan Control section.
<7>	R2T	R/W	R2T = 1 enables dynamic T <sub>MIN</sub> control on the Remote 2 temperature channel. The chosen T <sub>MIN</sub> value is dynamically adjusted based on the current temperature, operating point, and high and low limits for this zone. R2T = 0 disables dynamic T <sub>MIN</sub> control. The T <sub>MIN</sub> value chosen is not adjusted, and the channel behaves as described in the Automatic Fan Control section.

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

# ADT7460

**Table 45. Register 0x37 — Dynamic T<sub>MIN</sub> Control Register 2 (Power-On Default = 0x00) (Note 1)**

Bit No.	Mnemonic	R/W	Description		
<2:0>	CYR1	R/W	3-Bit Remote 1 Cycle Value. These three bits define the delay time between making subsequent T <sub>MIN</sub> adjustments in the control loop for the Remote 1 channel, in terms of number of monitoring cycles. 1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

# ADT7460

**Table 46. Register 0x40 — Configuration Register 1 (Power-On Default = 0x00)**

Bit No.	Mnemonic	R/W	Description
<0>	STRT	R/W	Logic 1 enables monitoring and PWM control outputs based on the limit settings programmed. Logic 0 disables monitoring and PWM control based on the default powerup limit settings. Note that the limit values programmed are preserved even if a Logic 0 is written to this bit and the default settings are enabled. This bit becomes read-only and cannot be changed once Bit 1 (lock bit) has been written. All limit registers should be programmed by BIOS before setting this bit to 1. (Lockable.)
<1>	LOCK	Write Once	Logic 1 locks all limit values to their current settings. Once this bit is set, all lockable registers become read-only and cannot be modified until the ADT7460 is powered down and powered up again. This prevents rogue programs such as viruses from modifying critical system limit settings. (Lockable.)
<2>	RDY	Read-only	This bit is set to 1 by the ADT7460 to indicate that the device is fully powered-up and ready to begin systems monitoring.
<3>	FSPD	R/W	When set to 1, all fans run at full speed. Power-on default = 0. (This bit cannot be locked.)
<4>	RES	Read-only	Reserved for future use.
<5>	FSPDIS	R/W	Logic 1 disables fan spin-up for two TACH pulses. Instead, the PWM outputs go high for the entire fan spin-up timeout selected.
<6>	TODIS	R/W	When set to 1, the SMBus timeout feature is disabled. This allows the ADT7460 to be used with SMBus controllers that cannot handle SMBus timeouts. (Lockable.)
<7>	V <sub>CC</sub>	R/W	When set to 1, the ADT7460 rescales its V <sub>CC</sub> pin to measure a 5.0 V supply. When set to 0, the ADT7460 measures V <sub>CC</sub> as a 3.3 V supply. (Lockable.)

**Table 47. Register 0x41 — Interrupt Status Register 1 (Power-On Default = 0x00)**

Bit No.	Mnemonic	R/W	Description
<0>	2.5V	Read-only	A 1 indicates that the 2.5 V high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<1>	RES	Read-only	Reserved for future use.
<2>	V <sub>CC</sub>	Read-only	A 1 indicates that the V <sub>CC</sub> high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<3>	RES	Read-only	Reserved for future use.
<4>	R1T	Read-only	A 1 indicates that the Remote 1 low or high temperature limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<5>	LT	Read-only	A 1 indicates the local low or high temperature limit has been exceeded. This bit is cleared on a read of the Status Register only if the error condition has subsided.
<6>	R2T	Read-only	A 1 indicates that the Remote 2 low or high temperature limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<7>	OOL	Read-only	A 1 indicates that an out-of-limit event has been latched in Status Register 2. This bit is a logical OR of all status bits in Status Register 2. Software can test this bit in isolation to determine whether any of the voltage, temperature, or fan speed readings represented by Status Register 2 are out-of-limit. This saves the need to read Status Register 2 every interrupt or polling cycle.

**Table 48. Register 0x42 — Interrupt Status Register 2 (Power-On Default = 0x00)**

Bit No.	Mnemonic	R/W	Description
<0>	RES	Read-only	Reserved for future use.
<1>	OVT	Read-only	A 1 indicates that one of the $\overline{\text{THERM}}$ overtemperature limits has been exceeded. This bit is cleared on a read of the status register when the temperature drops below $\overline{\text{THERM}} - T_{\text{HYST}}$ .
<2>	FAN1	Read-only	A 1 indicates that Fan 1 has dropped below minimum speed or has stalled. This bit is NOT set when the PWM1 output is off.
<3>	FAN2	Read-only	A 1 indicates that Fan 2 has dropped below minimum speed or has stalled. This bit is NOT set when the PWM2 output is off.
<4>	FAN3	Read-only	A 1 indicates that Fan 3 has dropped below minimum speed or has stalled. This bit is NOT set when the PWM3 output is off.
<5>	F4P	Read-only	A 1 indicates that Fan 4 has dropped below minimum speed or has stalled. This bit is NOT set when the PWM3 output is off. If Pin 9 is configured as the $\overline{\text{THERM}}$ timer input for $\overline{\text{THERM}}$ monitoring, this bit is set when the $\overline{\text{THERM}}$ assertion time exceeds the limit programmed in the $\overline{\text{THERM}}$ Limit Register (Reg. 0x7A).
<6>	D1	Read-only	A 1 indicates either an open or short circuit on the Thermal Diode 1 inputs.
<7>	D2	Read-only	A 1 indicates either an open or short circuit on the Thermal Diode 2 inputs.

**Table 49. Voltage Limit Registers** (Note 1)

Register Address	R/W	Description (Note 2)	Power-On Default
0x44	R/W	2.5 V Low Limit	0x00
0x45	R/W	2.5 V High Limit	0xFF
0x48	R/W	V <sub>CC</sub> Low Limit.	0x00
0x49	R/W	V <sub>CC</sub> High Limit.	0xFF

- Setting the Configuration Register 1 lock bit has no effect on these registers.
- High limits: an interrupt is generated when a value exceeds its high limit (> comparison); low limits: an interrupt is generated when a value is equal to or below its low limit ( $\leq$  comparison).

**Table 50. Temperature Limit Registers** (Note 1)

Register Address	R/W	Description (Note 2)	Power-On Default
0x4E	R/W	Remote 1 temperature low limit.	0x81
0x4F	R/W	Remote 1 temperature high limit.	0x7F
0x50	R/W	Local temperature low limit.	0x81
0x51	R/W	Local temperature high limit.	0x7F
0x52	R/W	Remote 2 temperature low limit.	0x81
0x53	R/W	Remote 2 temperature high limit.	0x7F

- Exceeding any of these temperature limits by 1°C causes the appropriate status bit to be set in the interrupt status register. Setting the Configuration Register 1 lock bit has no effect on these registers.
- High limits: an interrupt is generated when a value exceeds its high limit (> comparison); low limits: an interrupt is generated when a value is equal to or below its low limit ( $\leq$  comparison).

**Table 51. Fan Tachometer Limit Registers (Power-On Default = 0xFF)** (Note 1)

Register Address	R/W	Description
0x54	R/W	TACH1 minimum low byte.
0x55	R/W	TACH1 minimum high byte.
0x56	R/W	TACH2 minimum low byte.
0x57	R/W	TACH2 minimum high byte.
0x58	R/W	TACH3 minimum low byte.
0x59	R/W	TACH3 minimum high byte.
0x5A	R/W	TACH4 minimum low byte.
0x5B	R/W	TACH4 minimum high byte.

- Exceeding any of the TACH limit registers by 1 indicates that the fan is running too slowly or has stalled. The appropriate status bit is set in Interrupt Status Register 2 to indicate the fan failure. Setting the Configuration Register 1 lock bit has no effect on these registers.

**Table 52. PWM Configuration Registers (Power-On Default = 0x62)** (Note 1)

Register Address	R/W	Description
0x5C	R/W	PWM1 configuration.
0x5D	R/W	PWM2 configuration.
0x5E	R/W	PWM3 configuration.

1. These registers become read-only when the Configuration Register 1 lock bit is set to 1. Any subsequent attempts to write to these registers fail.

**Table 53. PWM Configuration Register Bits**

Bit No.	Mnemonic	R/W	Description
<2:0>	SPIN	R/W	These bits control the startup timeout for PWMx. The PWM output stays high until two valid TACH rising edges are seen from the fan. If there is not a valid TACH signal during the fan TACH measurement directly after the fan startup timeout period, the TACH measurement reads 0xFFFF and Status Register 2 reflects the fan fault. If the TACH minimum high and low byte contains 0xFFFF or 0x0000, the Status Register 2 bit is not set, even if the fan has not started.  000 = No startup timeout 001 = 100 ms 010 = 250 ms (default) 011 = 400 ms 100 = 667 ms 101 = 1 s 110 = 2 s 111 = 4 s
<3>	SLOW	R/W	SLOW = 1 makes the ramp rates for acoustic enhancement four times longer.
<4>	INV	R/W	This bit inverts the PWM output. The default is 0, which corresponds to a logic high output for 100% duty cycle. Setting this bit to 1 inverts the PWM output, so 100% duty cycle corresponds to a logic low output.
<7:5>	BHVR	R/W	These bits assign each fan to a particular temperature sensor for localized cooling. 000 = Remote 1 temperature controls PWMx (automatic fan control mode). 001 = Local temperature controls PWMx (automatic fan control mode). 010 = Remote 2 temperature controls PWMx (automatic fan control mode). 011 = PWMx runs full speed (default). 100 = PWMx is disabled. 101 = Fastest speed calculated by Local and Remote 2 Temperature Control PWMx. 110 = Fastest speed calculated by all three Temperature Channels Control PWMx. 111 = Manual mode. PWM duty cycle registers (Reg. 0x30–0x32) become writable.

**Table 54. Temp T<sub>RANGE</sub>/PWM Frequency Registers (Power-On Default = 0xC4)** (Note 1)

Register Address	R/W	Description
0x5F	R/W	Remote 1 T <sub>RANGE</sub> /PWM1 frequency.
0x60	R/W	Local Temp T <sub>RANGE</sub> /PWM2 frequency.
0x61	R/W	Remote 2 T <sub>RANGE</sub> /PWM3 frequency.

1. These registers become read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to the is register have no effect.

# ADT7460

**Table 55. Temp T<sub>RANGE</sub>/PWM Frequency Register Bits**

Bit No.	Mnemonic	R/W	Description
<2:0>	FREQ	R/W	<p>These bits control the PWMx frequency.</p> <p>000 = 11.0 Hz            001 = 14.7 Hz            010 = 22.1 Hz            011 = 29.4 Hz            100 = 35.3 Hz (default)            101 = 44.1 Hz            110 = 58.8 Hz            111 = 88.2 Hz</p>
<3>	THRM	R/W	<p>THRM = 1 causes the <math>\overline{\text{THERM}}</math> pin (Pin 9) to assert low as an output when this temperature channel's <math>\overline{\text{THERM}}</math> limit is exceeded by 0.25°C. The <math>\overline{\text{THERM}}</math> pin remains asserted until the temperature is equal to or below the <math>\overline{\text{THERM}}</math> limit. The minimum time that <math>\overline{\text{THERM}}</math> asserts for is one monitoring cycle. This allows clock modulation of devices that incorporate this feature.</p> <p>THRM = 0 makes the <math>\overline{\text{THERM}}</math> pin act as an input only, for example, for Pentium 4 <math>\overline{\text{PROCHOT}}</math> monitoring, when Pin 9 is configured as <math>\overline{\text{THERM}}</math>.</p>
<7:4>	RANGE	R/W	<p>These bits determine the PWM duty cycle vs. temperature slope for automatic fan control.</p> <p>0000 = 2°C            0001 = 2.5°C            0010 = 3.33°C            0011 = 4°C            0100 = 5°C            0101 = 6.67°C            0110 = 8°C            0111 = 10°C            1000 = 13.33°C            1001 = 16°C            1010 = 20°C            1011 = 26.67°C            1100 = 32°C (Default)            1101 = 40°C            1110 = 53.33°C            1111 = 80°C</p>

# ADT7460

111 = 48	0.8 sec																				
<7>	EN2	R/W	When this bit is 1, acoustic enhancement is enabled on PWM2 output.																		

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

**Table 58. PWM Min Duty Cycle Registers (Note 1)**

Register Address	R/W	Description	Power-On Default
0x64	R/W	PWM1 Min Duty Cycle	0x80 (50% duty cycle)
0x65	R/W	PWM2 Min Duty Cycle	0x80 (50% duty cycle)
0x66	R/W	PWM3 Min Duty Cycle	0x80 (50% duty cycle)

1. These registers become read-only when the ADT7460 is in automatic fan control mode.

**Table 59. PWM Min Duty Cycle Register Bits**

Bit No.	Mnemonic	R/W	Description
<7:0>	PWM Duty Cycle	R/W	<p>These bits define the PWM<sub>MIN</sub> duty cycle for PWMx.</p> <p>0x00 = 0% Duty Cycle (Fan Off)            0x40 = 25% Duty Cycle            0x80 = 50% Duty Cycle            0xFF = 100% Duty Cycle (Fan Full Speed)</p>

**Table 60. T<sub>MIN</sub> Registers (Note 1)**

Register Address	R/W	Description (Note 2)	Power-On Default
0x67	R/W	Remote 1 Temperature T <sub>MIN</sub>	0x5A (90°C)
0x68	R/W	Local Temperature T <sub>MIN</sub>	0x5A (90°C)
0x69	R/W	Remote 2 Temperature T <sub>MIN</sub>	0x5A (90°C)

1. These registers become read-only when the Configuration Register 1 lock bit is set. Further attempts to write to these registers have no effect.

2. These are the T<sub>MIN</sub> registers for each temperature channel. When the temperature measured exceeds T<sub>MIN</sub>, the appropriate fan runs at minimum speed and increase with temperature according to T<sub>RANGE</sub>.

**Table 61. THERM Limit Registers** (Note 1)

Register Address	R/W	Description (Note 2)	Power-On Default
0x6A	R/W	Remote 1 THERM Limit	0x64 (100°C)
0x6B	R/W	Local THERM Limit	0x64 (100°C)
0x6C	R/W	Remote 2 THERM Limit	0x64 (100°C)

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.
2. If any temperature measured exceeds its THERM limit, all PWM outputs drive their fans at 100% duty cycle. This is a fail-safe mechanism incorporated to cool the system in the event of a critical overtemperature. It also ensures some level of cooling in the event that software or hardware locks up. If set to 0x80, this feature is disabled. The PWM output remains at 100% until the temperature drops below THERM Limit – Hysteresis. If the THERM pin is programmed as an output, exceeding these limits by 0.25°C can cause the THERM pin to assert low as an output.

**Table 62. Temperature Hysteresis Registers** (Note 1)

Register Address	R/W	Description (Note 2)	Power-On Default
0x6D	R/W	Remote 1 Local Temperature Hysteresis	0x44
0x6E	R/W	Remote 2 Temperature Hysteresis	0x40

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.
2. Each 4-bit value controls the amount of temperature hysteresis applied to a particular temperature channel. Once the temperature for that channel falls below its T<sub>MIN</sub> value, the fan remains running at PWM<sub>MIN</sub> duty cycle until the temperature = T<sub>MIN</sub> – Hysteresis. Up to 15°C of hysteresis may be assigned to any temperature channel. The hysteresis value chosen also applies to that temperature channel if its THERM limit is exceeded. The PWM output being controlled goes to 100% if the THERM limit is exceeded and remains at 100% until the temperature drops below THERM – Hysteresis. For acoustic reasons, it is recommended that the hysteresis value not be programmed less than 4°C. Setting the hysteresis value lower than 4°C causes the fan to switch on and off regularly when the temperature is close to T<sub>MIN</sub>.

**Table 63. XNOR Tree Test Enable Register (Power-On Default = 0x00)** (Note 1)

Register Address	R/W	Description		
0x6F	R/W	XNOR Tree Test Enable		
		Bit	Mnemonic	Description
		<0>	XEN	If the XEN bit is set to 1, the device enters the XNOR tree test mode. Clearing the bit removes the device from the XNOR test mode.
<7:1>	RES	Unused. Do not write to these bits.		

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

**Table 64. Remote 1 Temperature Offset Register (Power-On Default = 0x00)** (Note 1)

Register Address	R/W	Description
0x70	R/W	Remote 1 Temperature Offset
<7:0>	R/W	Allows a twos complement offset value to be automatically added to or subtracted from the Remote 1 temperature reading. This is to compensate for any inherent system offsets such as PCB trace resistance. LSB value = 0.25°C.

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

**Table 65. Local Temperature Offset Register (Power-On Default = 0x00)** (Note 1)

Register Address	R/W	Description
0x71	R/W	Local Temperature Offset
<7:0>	R/W	Allows a twos complement offset value to be automatically added to or subtracted from the local temperature reading. LSB value = 0.25°C.

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

# ADT7460

**Table 66. Remote 2 Temperature Offset Register (Power-On Default = 0x00) (Note 1)**

Register Address	R/W	Description
0x72	R/W	Remote 2 Temperature Offset
<7:0>	R/W	Allows a twos complement offset value to be automatically added to or subtracted from the Remote 2 temperature reading. This is to compensate for any inherent system offsets such as PCB trace resistance. LSB value = 0.25°C.

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

**Table 67. Register 0x73 — Configuration Register 2 (Power-On Default = 0x00) (Note 1)**

Bit No.	Mnemonic	R/W	Description												
0	AIN1	R/W	AIN1 = 0, Speed of 3-wire fans measured using the TACH output from the fan. AIN1 = 1, Pin 6 is reconfigured to measure the speed of 2-wire fans using an external sensing resistor and coupling capacitor. AIN voltage threshold is set via Configuration Register 4 (Reg. 0x7D).												
1	AIN2	R/W	AIN2 = 0, Speed of 3-wire fans measured using the TACH output from the fan. AIN2 = 1, Pin 7 is reconfigured to measure the speed of 2-wire fans using an external sensing resistor and coupling capacitor. AIN voltage threshold is set via Configuration Register 4 (Reg. 0x7D).												
2	AIN3	R/W	AIN3 = 0, Speed of 3-wire fans measured using the TACH output from the fan. AIN3 = 1, Pin 4 is reconfigured to measure the speed of 2-wire fans using an external sensing resistor and coupling capacitor. AIN voltage threshold is set via Configuration Register 4 (Reg. 0x7D).												
3	AIN4	R/W	AIN4 = 0, Speed of 3-wire fans measured using the TACH output from the fan. AIN4 = 1, Pin 9 is reconfigured to measure the speed of 2-wire fans using an external sensing resistor and coupling capacitor. AIN voltage threshold is set via Configuration Register 4 (Reg. 0x7D).												
4	AVG	R/W	AVG = 1, Averaging on the temperature and voltage measurements is turned off. This allows measurements on each channel to be made much faster.												
5	ATTN	R/W	ATTN = 1, the ADT7460 removes the attenuators from the 2.5 V input. The input can be used for other functions such as connecting up external sensors.												
6	CONV	R/W	CONV = 1, the ADT7460 is put into a single-channel ADC conversion mode. In this mode, the ADT7460 can be made to read continuously from one input only, for example, Remote 1 temperature. It is also possible to start ADC conversions using an external clock on Pin 6 by setting Bit 2 of Test Register 2 (Reg. 0x7F). This mode could be useful if, for example, users wanted to characterize/profile CPU temperature quickly. The appropriate ADC channel is selected by writing to Bits <7:5> of TACH1 min high byte register (Reg. 0x55).												
			<table border="0" style="width: 100%;"> <tr> <td style="width: 50%;"><b>Bits &lt;7:5&gt; Reg. 0x55</b></td> <td style="width: 50%;"><b>Channel Selected</b></td> </tr> <tr> <td>000</td> <td>2.5V</td> </tr> <tr> <td>010</td> <td>V<sub>CC</sub> (3.3V)</td> </tr> <tr> <td>101</td> <td>Remote 1 Temp</td> </tr> <tr> <td>110</td> <td>Local Temp</td> </tr> <tr> <td>111</td> <td>Remote 2 Temp</td> </tr> </table>	<b>Bits &lt;7:5&gt; Reg. 0x55</b>	<b>Channel Selected</b>	000	2.5V	010	V <sub>CC</sub> (3.3V)	101	Remote 1 Temp	110	Local Temp	111	Remote 2 Temp
<b>Bits &lt;7:5&gt; Reg. 0x55</b>	<b>Channel Selected</b>														
000	2.5V														
010	V <sub>CC</sub> (3.3V)														
101	Remote 1 Temp														
110	Local Temp														
111	Remote 2 Temp														
7	SHDN	R/W	SHDN = 1, ADT7460 goes into shutdown mode. All PWM outputs assert low (or high depending, on state of INV bit) to switch off all fans. The PWM current duty cycle registers read 0x00 to indicate that the fans are not being driven.												

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

**Table 68. Register 0x74 — Interrupt Mask Register 1 (Power-On Default <7:0> = 0x00)**

Bit No.	Mnemonic	R/W	Description
0	2.5V	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for out-of-limit conditions on the 2.5 V channel.
1	RES	R/W	Reserved for future use.
2	V <sub>CC</sub>	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for out-of-limit conditions on the V <sub>CC</sub> channel.
3	RES	R/W	Reserved for future use.
4	R1T	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for out-of-limit conditions on the Remote 1 temperature channel.
5	LT	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for out-of-limit conditions on the Local temperature channel.
6	R2T	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for out-of-limit conditions on the Remote 2 temperature channel.
7	OOL	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for any out-of-limit condition in Status Register 2.

**Table 69. Register 0x75 — Interrupt Mask Register 2 (Power-On Default = 0x00)**

Bit No.	Mnemonic	R/W	Description
0	RES	R/W	Reserved for future use.
1	OVT	Read-only	A 1 masks $\overline{\text{SMBALERT}}$ for overtemperature $\overline{\text{THERM}}$ conditions.
2	FAN1	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for a Fan 1 fault.
3	FAN2	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for a Fan 2 fault.
4	FAN3	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for a Fan 3 fault.
5	F4P	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for a Fan 4 fault. If the TACH4 pin is being used as the $\overline{\text{THERM}}$ input, this bit masks $\overline{\text{SMBALERT}}$ for a $\overline{\text{THERM}}$ timer event.
6	D1	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for a diode open or short on Remote 1 channel.
7	D2	R/W	A 1 masks $\overline{\text{SMBALERT}}$ for a diode open or short on Remote 2 channel.

**Table 70. Register 0x76 — Extended Resolution Register 1**

Bit No.	Mnemonic	R/W	Description
<1:0>	2.5V	Read-only	2.5 V LSBs. Holds the 2 LSBs of the 10-bit 2.5 V measurement.
<3:2>	RES	R/W	Reserved for future use.
<5:4>	V <sub>CC</sub>	Read-only	V <sub>CC</sub> LSBs. Holds the 2 LSBs of the 10-bit V <sub>CC</sub> measurement.
<7:6>	RES	R/W	Reserved for future use.

1. If this register is read, this register and the registers holding the MSB of each reading are frozen until read.

**Table 71. Register 0x77 — Extended Resolution Register 2 (Note 1)**

Bit No.	Mnemonic	R/W	Description
<1:0>	RES	R/W	Reserved for future use.
<3:2>	TDM1	Read-only	Remote 1 Temperature LSBs. Holds the 2 LSBs of the 10-bit Remote 1 temperature measurement.
<5:4>	LTMP	Read-only	Local Temperature LSBs. Holds the 2 LSBs of the 10-bit local temperature measurement.
<7:6>	TDM2	Read-only	Remote 2 Temperature LSBs. Holds the 2 LSBs of the 10-bit Remote 2 temperature measurement.

1. If this register is read, this register and the registers holding the MSB of each reading are frozen until read.

**Table 72. Register 0x78 — Configuration Register 3 (Power-On Default = 0x00) (Note 1)**

Bit No.	Mnemonic	R/W	Description
<0>	ALERT	R/W	ALERT = 1, Pin 5 (PWM2/ $\overline{\text{SMBALERT}}$ ) is configured as an $\overline{\text{SMBALERT}}$ interrupt output to indicate out-of-limit error conditions.
<1>	THERM ENABLE	R/W	THERM ENABLE = 1 enables THERM monitoring functionality on Pin 9 when it is configured as $\overline{\text{THERM}}$ . When $\overline{\text{THERM}}$ is asserted, fans can be run at full speed (if the BOOST bit is set), or a timer can be triggered to time how long $\overline{\text{THERM}}$ has been asserted for.
<2>	BOOST	R/W	BOOST = 1, assertion of $\overline{\text{THERM}}$ causes all fans to run at 100% duty cycle for fail-safe cooling.
<3>	FAST	R/W	FAST = 1 enables fast TACH measurements on all channels. This increases the TACH measurement rate from once per second, to once every 250 ms (4x).
<4>	DC1	R/W	DC1 = 1 enables TACH measurements to be continuously made on TACH1.
<5>	DC2	R/W	DC2 = 2 enables TACH measurements to be continuously made on TACH2.
<6>	DC3	R/W	DC3 = 1 enables TACH measurements to be continuously made on TACH3.
<7>	DC4	R/W	DC4 = 1 enables TACH measurements to be continuously made on TACH4.

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

Table 73. Register 0x79 —  $\overline{\text{THERM}}$  Status Register (Power-On Default = 0x00)

Bit No.	Mnemonic	R/W	Description
<7:1>	TMR	Read-only	Times how long $\overline{\text{THERM}}$ input is asserted. These seven bits read 0 until the $\overline{\text{THERM}}$ assertion time exceeds 45.52 ms.
<0>	ASRT/TMR0	Read-only	Is set high on the assertion of the $\overline{\text{THERM}}$ input. Cleared on read. If the $\overline{\text{THERM}}$ assertion time exceeds 45.52 ms, this bit is set and becomes the LSB of the 8-bit TMR reading. This allows $\overline{\text{THERM}}$ assertion times from 45.52 ms to 5.82 s to be reported back with a resolution of 22.76 ms.

Table 74. Register 0x7A —  $\overline{\text{THERM}}$  Limit Register (Power-On Default = 0x00)

Bit No.	Mnemonic	R/W	Description
<7:0>	LIMIT	R/W	Sets maximum $\overline{\text{THERM}}$ assertion length allowed before an interrupt is generated. This is an 8-bit limit with a resolution of 22.76 ms allowing $\overline{\text{THERM}}$ assertion limits of 45.52 ms to 5.82 s to be programmed. If the $\overline{\text{THERM}}$ assertion time exceeds this limit, Bit 5 (F4P) of Interrupt Status Register 2 (Reg. 0x42) is set. If the limit value is 0x00, an interrupt is generated immediately upon the assertion of the $\overline{\text{THERM}}$ input.

Table 75. Register 0x7B — Fan Pulses per Revolution Register (Power-On Default = 0x55)

Bit No.	Mnemonic	R/W	Description
<1:0>	FAN1	R/W	Sets number of pulses to be counted when measuring Fan1 speed. Can be used to determine fan's pulses per revolution for unknown fan type. <b>Pulses Counted</b> 00 = 1 01 = 2 (Default) 10 = 3 11 = 4
<3:2>	FAN2	R/W	Sets number of pulses to be counted when measuring FAN2 speed. Can be used to determine fan's pulses per revolution for unknown fan type. <b>Pulses Counted</b> 00 = 1 01 = 2 (Default) 10 = 3 11 = 4
<5:4>	FAN3	R/W	Sets number of pulses to be counted when measuring FAN3 speed. Can be used to determine fan's pulses per revolution for unknown fan type. <b>Pulses Counted</b> 00 = 1 01 = 2 (Default) 10 = 3 11 = 4
<7:6>	FAN4	R/W	Sets number of pulses to be counted when measuring FAN4 speed. Can be used to determine fan's pulses per revolution for unknown fan type. <b>Pulses Counted</b> 00 = 1 01 = 2 (Default) 10 = 3 11 = 4

Table 76. Register 0x7D — Configuration Register 4 (Power-On Default = 0x00) (Note 1)

Bit No.	Mnemonic	R/W	Description
<0>	AL2.5V	R/W	AL2.5V = 1, Pin 14 (2.5 V/SMBALERT) is configured as an $\overline{\text{SMBALERT}}$ interrupt output to indicate out-of-limit error conditions. AL2.5V = 0, Pin 14 (2.5 V/SMBALERT) is configured as a 2.5 V measurement input.
<1>	RES	Read-only	Reserved for future use.
<3:2>	AINL	R/W	These two bits define the input threshold for 2-wire fan speed measurements: 00 = $\pm 20$ mV 01 = $\pm 40$ mV 10 = $\pm 80$ mV 11 = $\pm 130$ mV
<7:4>	RES		Reserved for future use.

1. This register becomes read-only when the Configuration Register 1 lock bit is set to 1. Further attempts to write to this register have no effect.

# ADT7460

**Table 77. Register 0x7E — Manufacturer's Test Register 1 (Power-On Default = 0x00)**

Bit No.	Mnemonic	R/W	Description
<7:0>	RES	Read-only	Manufacturer's Test Register. These bits are reserved for manufacturer's test purposes and should NOT be written to under normal operation.

**Table 78. Register 0x7F — Manufacturer's Test Register 2 (Power-On Default = 0x00)**

Bit No.	Mnemonic	R/W	Description
<7:0>	RES	Read-only	Manufacturer's Test Register. These bits are reserved for manufacturer's test purposes and should NOT be written to under normal operation.

## PACKAGE DIMENSIONS

QSOP16  
CASE 492-01  
ISSUE O

### NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: INCH.
3. THE BOTTOM PACKAGE SHALL BE BIGGER THAN THE TOP PACKAGE BY 4 MILS (NOTE: LEAD SIDE ONLY). BOTTOM PACKAGE DIMENSION SHALL FOLLOW THE DIMENSION STATED IN THIS DRAWING.
4. PLASTIC DIMENSIONS DOES NOT INCLUDE MOLD FLASH OR PROTRUSIONS. MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED 6 MILS PER SIDE.
5. BOTTOM EJECTOR PIN WILL INCLUDE THE COUNTRY OF ORIGIN (COO) AND MOLD CAVITY I.D.
