# Technology Solutions

M/A-COM Products Released - Rev. 05202009

# The RF MOSFET Line 15W, to 400MHz, 28V

Designed for wideband large signal amplifier and oscillator applications Up to 400 MHz range, in single-ended configuration

N-Channel enhancement mode

- Guaranteed 28 volt, 150 MHz performance Output power = 15 watts Narrowband gain = 16 dB (Typ.) Efficiency = 60% (Typ.)
- Small– and large–signal characterization
- 100% tested for load mismatch at all phase angles with 30:1 VSWR
- Excellent thermal stability, ideally suited for Cass A operation
- Facilitates manual gain control, ALC and modulation techniques

#### Product Image

#### MAXIMUM RATINGS

Rating	Symbol	Value	Unit			
Drain–Source Voltage	VDSS	65	Vdc			
Drain–Gate Voltage (R <sub>GS</sub> = 1.0 MΩ)	VDGR	65	Vdc			
Gate-Source Voltage	VGS	±40	Vdc			
Drain Current — Continuous	ID	2.5	Adc			
Total Device Dissipation @ T <sub>C</sub> = 25°C Derate above 25°C	PD	55 0.314	Watts W/∘C			
Storage Temperature Range	T <sub>stg</sub>	-65 to +150	°C			
Operating Junction Temperature	Tj	200	°C			
THERMAL CHARACTERISTICS						

Characteristic		Мах	Unit
Thermal Resistance, Junction to Case		3.2	°C/W

NOTE – <u>CAUTION</u> – MOS devices are susceptible to damage from electrostatic charge. Reasonable precautions in handling and packaging MOS devices should be observed.

M/A-COM Products Released - Rev. 05202009

#### **RF POWER MOSFET CONSIDERATIONS**

#### **DESIGN CONSIDERATIONS**

The MRF137 is a RF power N–Channel enhancementmode field–effect transistor (FET) designed especially for VHF power amplifier applications. M/A-COM RF MOS FETs feature a vertical structure with a planar design, thus avoiding the processing difficulties associated with V– groove vertical power FETs.

M/A-COM Application Note AN211A, FETs in Theory and-Practice, is suggested reading for those not familiar with the construction and characteristics of FETs.

The major advantages of RF power FETs include high gain, low noise, simple bias systems, relative immunity from thermal runaway, and the ability to withstand severely mismatched loads without suffering damage. Power output can be varied over a wide range with a low power dc control signal, thus facilitating manual gain control, ALC and modulation.

#### DC BIAS

The MRF137 is an enhancement mode FET and, therefore, does not conduct when drain voltage is applied. Drain current flows when a positive voltage is applied to the gate. See Figure 10 for a typical plot of drain current versus gate voltage. RF power FETs require forward bias for optimum performance.

The value of quiescent drain current (IDQ) is not critical formany applications. The MRF137 was characterized at IDQ = 25 mA, which is the suggested minimum value of IDQ. For special applications such as linear amplification, IDQ may have to be selected to optimize the critical parameters.

The gate is a dc open circuit and draws no current. Therefore, the gate bias circuit may generally be just a simple

# resistive divider network. Some special applications may require a more elaborate bias system. **GAIN CONTROL**

Power output of the MRF137 may be controlled from its rated value down to zero (negative gain) by varying the dc gate voltage. This feature facilitates the design of manual gain control, AGC/ALC and modulation systems. (See Figure 9.)

#### **AMPLIFIER DESIGN**

Impedance matching networks similar to those used with bipolar VHF transistors are suitable for MRF137. See M/A-COM Application Note AN721, Impedance Matching Networks Applied to RF Power Transistors. The higher input impedance of RF MOS FETs helps ease the task of broadband network design. Both small signal scattering parameters and large signal impedances are provided. While the s-parameters will not produce an exact design solution for high power operation, they do yield a good first approximation. This is an additional advantage of RF MOS power FETs.

RF power FETs are triode devices and, therefore, not unilateral. This, coupled with the very high gain of the MRF137, yields a device capable of self oscillation. Stability may be achieved by techniques such as drain loading, input shunt resistive loading, or output to input feedback. Two port parameter stability analysis with the MRF137 sparameters provides a useful tool for selection of loading or feedback circuitry to assure stable operation. See M/A-COM Application Note AN215A for a discussion of two port network theory and stability.

#### LOW NOISE OPERATION

Input resistive loading will degrade noise performance, and noise figure may vary significantly with gate driving impedance. A low loss input matching network with its gate impedance optimized for lowest noise is recommended.
