

## 1A Low Dropout CMOS Linear Regulators Stable with Ceramic Output Capacitors

### General Description

The LP38690/2 low dropout CMOS linear regulators provide tight output tolerance (2.5% typical), extremely low dropout voltage (450mV @ 1A load current,  $V_{OUT} = 5V$ ), and excellent AC performance utilizing ultra low ESR ceramic output capacitors.

The low thermal resistance of the LLP, SOT-223 and T0-252 packages allow the full operating current to be used even in high ambient temperature environments.

The use of a PMOS power transistor means that no DC base drive current is required to bias it allowing ground pin current to remain below 100  $\mu A$  regardless of load current, input voltage, or operating temperature.

**Dropout Voltage:** 450 mV (typ) @ 1A (typ. 5V out).

**Ground Pin Current:** 55  $\mu A$  (typ) at full load.

**Precision Output Voltage:** 2.5% (25°C) accuracy.

### Features

- 2.5% output accuracy (25°C)
- Low dropout voltage: 450mV @ 1A (typ, 5V out)
- Wide input voltage range (2.7V to 10V)
- Precision (trimmed) bandgap reference
- Guaranteed specs for -40°C to +125°C
- 1 $\mu A$  off-state quiescent current
- Thermal overload protection
- Foldback current limiting
- T0-252, SOT-223 and 6-Lead LLP packages
- Enable pin (LP38692)

### Applications

- Hard Disk Drives
- Notebook Computers
- Battery Powered Devices
- Portable Instrumentation

### Typical Application Circuits

Note: \* Minimum value required for stability.

\*\*LLP package devices only.

## Ordering Information

| Order Number   | Package Marking | Package Type | Package Drawing | Supplied As              |
|----------------|-----------------|--------------|-----------------|--------------------------|

**Note 1:** Absolute maximum ratings indicate limits beyond which damage to the component may occur. Operating ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications, see Electrical Characteristics. Specifications do not apply when operating the device outside of its rated operating conditions.

**Note 2:** At elevated temperatures, device power dissipation must be derated based on package thermal resistance and heatsink values (if a heatsink is used). The junction-to-ambient thermal resistance ( $\theta_{J-A}$ ) for the TO-252 is approximately 90°C/W for a PC board mounting with the device soldered down to minimum copper area (less than 0.1 square inch). If one square inch of copper is used as a heat dissipator for the TO-252, the  $\theta_{J-A}$  drops to approximately 50°C/W. The SOT-223 package has a  $\theta_{J-A}$  of approximately 125°C/W when soldered down to a minimum sized pattern (less than 0.1 square inch) and approximately 70°C/W when soldered to a copper area of one square inch. The  $\theta_{J-A}$  values for the LLP package are also dependent on trace area, copper thickness, and the number of thermal vias used (refer to application note AN-1187). If power dissipation causes the junction temperature to exceed specified limits, the device will go into thermal shutdown.

**Note 3:** ESD is tested using the human body model which is a 100pF capacitor discharged through a 1.5k resistor into each pin.

**Note 4:** Typical numbers represent the most likely parametric norm for 25°C operation.

**Note 5:** If used in a dual-supply system where the regulator load is returned to a negative supply, the output pin must be diode clamped to ground.

**Note 6:** Output voltage line regulation is defined as the change in output voltage from nominal value resulting from a change in input voltage.

**Note 7:** Output voltage load regulation is defined as the change in output voltage from nominal value as the load current increases from 1mA to full load.

**Note 8:** Dropout voltage is defined as the minimum input to output differential required to maintain the output within 100mV of nominal value.
