

# LM2937

## 500 mA Low Dropout Regulator

### General Description

The LM2937 is a positive voltage regulator capable of supplying up to 500 mA of load current. The use of a PNP power transistor provides a low dropout voltage characteristic. With a load current of 500 mA the minimum input to output voltage differential required for the output to remain in regulation is typically 0.5V (1V guaranteed maximum over the full operating temperature range). Special circuitry has been incorporated to minimize the quiescent current to typically only 10 mA with a full 500 mA load current when the input to output voltage differential is greater than 3V.

The LM2937 requires an output bypass capacitor for stability. As with most low dropout regulators, the ESR of this capacitor remains a critical design parameter, but the LM2937 includes special compensation circuitry that relaxes ESR requirements. The LM2937 is stable for all ESR below  $3\Omega$ . This allows the use of low ESR chip capacitors.

Ideally suited for automotive applications, the LM2937 will protect itself and any load circuitry from reverse battery

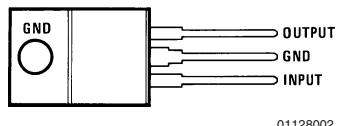

connections, two-battery jumps and up to +60V/-50V load dump transients. Familiar regulator features such as short circuit and thermal shutdown protection are also built in.

### Features

- Fully specified for operation over  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Output current in excess of 500 mA
- Output trimmed for 5% tolerance under all operating conditions
- Typical dropout voltage of 0.5V at full rated load current
- Wide output capacitor ESR range, up to  $3\Omega$
- Internal short circuit and thermal overload protection
- Reverse battery protection
- 60V input transient protection
- Mirror image insertion protection

## Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Input Voltage							
Continuous	26V						230°C
Transient ( $t \leq 100$ ms)	60V						215°C
Internal Power Dissipation (Note 2)	Internally Limited						220°C
Maximum Junction Temperature	150°C						ESD Susceptibility (Note 3) 2 kV
Storage Temperature Range	-65°C to +150°C						
TO-220 (10 seconds)	260°C						

## Operating Conditions (Note 1)

Temperature Range (Note 2)				
LM2937ET, LM2937ES			-40°C ≤ $T_J \leq 125$ °C	
LM2937IMP			-40°C ≤ $T_J \leq 85$ °C	
Maximum Input Voltage				26V

## Electrical Characteristics

$V_{IN} = V_{NOM} + 5V$ , (Note 4)  $I_{OUTmax} = 500$  mA for the TO-220 and TO-263 packages,  $I_{OUTmax}=400$ mA for the SOT-223 package,  $C_{OUT} = 10 \mu F$  unless otherwise indicated. **Boldface limits apply over the entire operating temperature range of the indicated device.**, all other specifications are for  $T_A = T_J = 25$ °C.

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Electrical specifications do not apply when operating the device outside of its rated Operating Conditions.

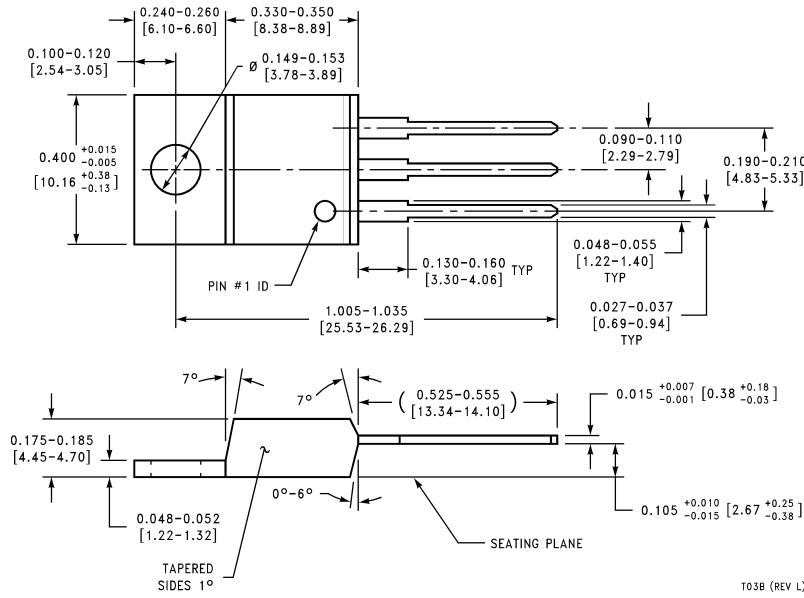

**Note 2:** The maximum allowable power dissipation at any ambient temperature is  $P_{MAX} = (125 - T_A)/\theta_{JA}$ , where 125 is the maximum junction temperature for operation,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance. If this dissipation is exceeded, the die temperature will rise above  $125^\circ C$  and the electrical specifications do not apply. If the die temperature rises above  $150^\circ C$ , the LM2937 will go into thermal shutdown. For the LM2937, the junction-to-ambient thermal resistance  $\theta_{JA}$  is  $65^\circ C/W$ , for the TO-220 package,  $73^\circ C/W$  for the TO-263 package, and  $174^\circ C/W$  for the SOT-223 package. When used with a heatsink,  $\theta_{JA}$  is the sum of the LM2937 junction-to-case thermal resistance  $\theta_{JC}$  of  $3^\circ C/W$  and the heatsink case-to-ambient thermal resistance. If the TO-263 or SOT-223 packages are used, the thermal resistance can be reduced by increasing the P.C. board copper area thermally connected to the package (see Application Hints for more information on heatsinking).

**Note 3:** ESD rating is based on the human body model, 100 pF discharged through 1.5 k $\Omega$ .

**Note 4:** Typicals are at  $T_J = 25^\circ C$  and represent the most likely parametric norm.
