## Low Noise, Low Power, $I^{2} C^{\circledR}$ Bus, 256 Taps

The ISL22343 integrates four digitally controlled potentiometers (DCP), control logic and non-volatile memory on a monolithic CMOS integrated circuit.

The digitally controlled potentiometer is implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the $I^{2} \mathrm{C}$ bus interface. The potentiometer has an associated volatile Wiper Register (WRi) and a non-volatile Initial Value Register (IVRi) that can be directly written to and read by the user. The contents of the WRi control the position of the corresponding wiper. At power up the device recalls the contents of the DCP's IVRi to the correspondent WRi.

The ISL22343 also has 11 general purpose non-volatile registers that can be used as storage of lookup table for multiple wiper position or any other valuable information.

The ISL22343 features a dual supply, that is beneficial for applications requiring a bipolar range for DCP terminals between V - and VCC.

Each DCP can be used as three-terminal potentiometers or as two-terminal variable resistors in a wide variety of applications including control, parameter adjustments, and signal processing.

## Features

- Four potentiometers in one package
- 256 resistor taps
- $\mathrm{I}^{2} \mathrm{C}$ serial interface
- Three address pins, up to eight devices per bus
- Non-volatile EEPROM storage of wiper position
- 11 General Purpose non-volatile registers
- High reliability
- Endurance: 1,000,000 data changes per bit per register
- Register data retention: 50 years @ $\mathrm{T} \leq+55^{\circ} \mathrm{C}$
- Wiper resistance: $70 \Omega$ typical @ 1mA
- Standby current $<4 \mu \mathrm{~A}$ max
- Shutdown current $<4 \mu \mathrm{~A}$ max
- Dual power supply
- $\mathrm{VCC}=2.25 \mathrm{~V}$ to 5.5 V
- V - $=-2.25 \mathrm{~V}$ to -5.5 V
- $10 \mathrm{k} \Omega, 50 \mathrm{k} \Omega$ or $100 \mathrm{k} \Omega$ total resistance
- Extended industrial temperature range: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
- 20 Lead TSSOP or 20 Lead QFN
- Pb-free plus anneal product (RoHS compliant)

## Ordering Information

| PART NUMBER <br> (Notes 1, 2) | PART MARKING | RESISTANCE OPTION ( $k \Omega$ ) | TEMPERATURE RANGE ( ${ }^{\circ} \mathrm{C}$ ) | PACKAGE (Pb-free) | PKG. DWG. \# |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ISL22343TFV20Z | 22343 TFVZ | 100 | -40 to +125 | 20 Ld TSSOP | M20.173 |
| ISL22343TFR20Z | 22343 TFRZ | 100 | -40 to +125 | 20 Ld QFN | L20.5x5 |
| ISL22343UFV20Z | 22343 UFVZ | 50 | -40 to +125 | 20 Ld TSSOP | M20.173 |
| ISL22343UFR20Z | 22343 UFRZ | 50 | -40 to +125 | 20 Ld QFN | L20.5x5 |
| ISL22343WFV20Z | 22343 WFVZ | 10 | -40 to +125 | 20 Ld TSSOP | M20.173 |
| ISL22343WFR20Z | 22343 WFRZ | 10 | -40 to +125 | 20 Ld QFN | L20.5×5 |

NOTES:

1. Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and $100 \%$ matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
2. Add "-TK" suffix for 1,000 Tape and Reel option

## Block Diagram

## Pinouts

## Pin Descriptions

| TSSOP PIN | QFN PIN | SYMBOL | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1 | 19 | RH3 | "High" terminal of DCP3 |
| 2 | 20 | RL3 | "Low" terminal of DCP3 |
| 3 | 1 | RW3 | "Wiper" terminal of DCP3 |
| 4 | 2 | A2 | Device address input for the $\mathrm{I}^{2} \mathrm{C}$ interface |
| 5 | 3 | SCL | Open drain $I^{2} \mathrm{C}$ interface clock input |
| 6 | 4 | SDA | Open drain Serial data $\mathrm{I} / \mathrm{O}$ for the $\mathrm{I}^{2} \mathrm{C}$ interface |
| 7 | 5 | GND | Device ground pin |
| 8 | 6 | RW2 | "Wiper" terminal of DCP2 |
| 9 | 7 | RL2 | "Low" terminal of DCP2 |
| 10 | 8 | RH2 | "High" terminal of DCP2 |
| 11 | 9 | RW1 | "Wiper" terminal of DCP1 |
| 12 | 10 | RL1 | "Low" terminal of DCP1 |
| 13 | 11 | RH1 | "High" terminal of DCP1 |
| 14 | 12 | A0 | Device address input for the $\mathrm{I}^{2} \mathrm{C}$ interface |
| 15 | 13 | A1 | Device address input for the $\mathrm{I}^{2} \mathrm{C}$ interface |
| 16 | 14 | Vcc | Positive power supply pin |
| 17 | 15 | V- | Negative power supply pin |
| 18 | 16 | RH0 | "High" terminal of DCPO |
| 19 | 17 | RLO | "Low" terminal of DCPO |
| 20 | 18 | RW0 | "Wiper" terminal of DCPO |
|  | EPAD* |  | Exposed Die Pad internally connected to V- |

## Absolute Maximum Ratings

| Storage Te | $65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| :---: | :---: |
| Voltage at any Digital Interface Pin with Respect to GND | $0.3$ |
| $\mathrm{V}_{\mathrm{Cc}}$ | -0.3 V to +6V |
| V- | -6V to 0.3V |
| Voltage at any DCP Pin with respect to GND. | V- to $\mathrm{V}_{\mathrm{CC}}$ |
| IW (10s) | $\pm 6 \mathrm{~mA}$ |
| Latchup | Level A at $+125^{\circ} \mathrm{C}$ |
| ESD |  |
| Human Body Model | 3.5kV |
|  | 400V |

## Thermal Information

| Thermal Resistance (Typical, Note 3) | $\theta_{\mathrm{JA}}\left({ }^{\circ} \mathrm{C} / \mathrm{W}\right)$ |
| :---: | :---: |
| 20 Lead TSSOP . | . 95 |
| 20 Lead QFN | 32 |
| Maximum Junction Temperature (Plastic Package) | $50^{\circ} \mathrm{C}$ |
| Pb -free reflow profile http://www.intersil.com/pbfree/Pb-FreeReflow.a | link below |

## Recommended Operating Conditions

| Temperature Range (Full Industrial) | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| :---: | :---: |
| Power Rating | 15 mW |
| $\mathrm{V}_{\mathrm{CC}}$ | 2.25 V to 5.5 V |
|  | -2.25 V to -5.5V |
| Max Wiper Current Iw | $\pm 3.0 \mathrm{~mA}$ |

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:
3. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

## Analog Specifications Over recommended operating conditions unless otherwise stated.

NOTES:
4. Typical values are for $T_{A}=+25^{\circ} \mathrm{C}$ and 3.3 V supply voltage.
5. LSB: $\left[V\left(R_{W}\right)_{255}-V\left(R_{W}\right)_{0}\right] / 255 . ~ V\left(R_{W}\right)_{255}$ and $V\left(R_{W}\right)_{0}$ are $V\left(R_{W}\right)$ for the $D C P$ register set to $F F$ hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
6. ZS error $=\mathrm{V}(\mathrm{RW})_{0^{\prime}} / \mathrm{LSB}$.
7. FS error $=\left[V(R W)_{255}-V_{C C}\right] / L S B$.
8. $D N L=\left[V(R W)_{i}-V(R W)_{i-1}\right] / L S B-1$, for $i=1$ to 255 . $i$ is the $D C P$ register setting.
9. $I N L=\left[V(R W)_{i}-i \cdot L S B-V(R W)_{0}\right] / L S B$ for $i=1$ to 255 .
10. $\mathrm{V}_{\mathrm{MATCH}}=[\mathrm{V}(\mathrm{RW} \mathrm{x}) \mathrm{i}-\mathrm{V}(\mathrm{RWy}) \mathrm{i}] / \mathrm{LSB}$, for $\mathrm{i}=0$ to $255, \mathrm{x}=0$ to $3, \mathrm{y}=0$ to 3 .
11. $\mathrm{TC}_{\mathrm{V}}=\frac{\operatorname{Max}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)-\operatorname{Min}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)}{\left[\operatorname{Max}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)+\operatorname{Min}\left(\mathrm{V}(\mathrm{RW})_{\mathrm{i}}\right)\right] / 2} \times \frac{10^{6}}{}+165^{\circ} \mathrm{C}$ for $\mathrm{i}=16$ to 240 decimal, $\mathrm{T}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. $\operatorname{Max}()$ is the maximum value of the wiper Min() is the minimum value of the wiper voltage over the temperature range.
12. $\mathrm{MI}=\left|R W_{255}-R W_{0}\right| 255$. MI is a minimum increment. $R W_{255}$ and $R W_{0}$ are the measured resistances for the DCP register set to $F F$ hex and 00 hex respectively.
13. Roffset $=R W_{0} / M I$, when measuring between RW and RL.

Roffset $=R W_{255} / \mathrm{MI}$, when measuring between RW and RH.
14. $R D N L=\left(R W_{i}-R W_{i-1}\right) / M I-1$, for $i=16$ to 255.
15. $\mathrm{RINL}=\left[R W_{i}-(\mathrm{MI} \bullet \mathrm{i})-R W_{0}\right] / M I$, for $i=16$ to 255 .
16. $\mathrm{R}_{\text {MATCH }}=[(\mathrm{Rx}) \mathrm{i}-(\mathrm{Ry}) \mathrm{i}] / \mathrm{MI}$, for $\mathrm{i}=0$ to $255, \mathrm{x}=0$ to $3, \mathrm{y}=0$ to 3 .
17. $\mathrm{TC}_{\mathrm{R}}=\frac{[\mathrm{Max}(\mathrm{Ri})-\mathrm{Min}(\mathrm{Ri})]}{[\mathrm{Max}(\mathrm{Ri})} \times \frac{10^{6}}{}$ for $\mathrm{i}=16$ to $240, \mathrm{~T}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C} . \operatorname{Max}()$ is the maximum value of the resistance and Min() is $T C_{R}=\frac{[\mathrm{Max}(\mathrm{Ri})-\mathrm{Min}(\mathrm{Ri})]}{[\mathrm{Max}(\mathrm{Ri})+\operatorname{Min}(\mathrm{Ri})] / 2} \times \frac{10^{\circ}}{}+165^{\circ} \mathrm{C}$ the minimum value of the resistance over the temperature range.
18. This parameter is not $100 \%$ tested.
19. ${ }^{\mathrm{T}} \mathrm{WC}$ is the time from a valid STOP condition at the end of a Write sequence of $\mathrm{I}^{2} \mathrm{C}$ serial interface, to the end of the self-timed internal non-volatile write cycle.

## Pin Description

## Potentiometers Pins

## RHi and RLi

The high ( RHi ) and low (RLi) terminals of the ISL22343 are equivalent to the fixed terminals of a mechanical potentiometer. RHi and RLi are referenced to the relative position of the wiper and not the voltage potential on the terminals. With WRi set to 255 decimal, the wiper will be closest to RHi , and with the WRi set to 0 , the wiper is closest to RLi.

## RWi

RWi is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the WRi register.

## Bus Interface Pins

## Serial Data Input/Output (SDA)

The SDA is a bidirectional serial data input/output pin for $I^{2} C$ interface. It receives device address, operation code, wiper address and data from an $I^{2} \mathrm{C}$ external master device at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock.

SDA requires an external pull-up resistor, since it is an open drain input/output.

## Serial Clock (SCL)

This input is the serial clock of the $I^{2} \mathrm{C}$ serial interface. SCL requires an external pull-up resistor, since it is an open drain input.

## Device Address (A2, A1, A0)

The address inputs are used to set three least significant bits of the 7 -bit $I^{2} \mathrm{C}$ interface slave address. A match in the slave address serial data stream must match with the Address input pins in order to initiate communication with the

FIGURE 14. LARGE SIGNAL SETTLING TIME

ISL22343. A maximum of eight ISL22343 devices may occupy the $\mathrm{I}^{2} \mathrm{C}$ serial bus (See Table 3).

## Principles of Operation

The ISL22343 is an integrated circuit incorporating four DCPs with its associated registers, non-volatile memory and an $\mathrm{I}^{2} \mathrm{C}$ serial interface providing direct communication between a host and the potentiometer and memory. The resistor arrays are comprised of individual resistors connected in a series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The electronic switches on the device operate in a "make before break" mode when the wiper changes tap positions.
When the device is powered down, the last value stored in IVRi will be maintained in the non-volatile memory. When power is restored, the contents of the IVRi are recalled and loaded into the corresponding WRi to set the wipers to their initial positions.

## DCP Description

The DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer (RHi and RLi pins). The RWi pin of the DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by an 8-bit volatile Wiper Register (WRi). When the WRi of a DCP contains all zeroes (WRi[7:0]= 00h), its wiper terminal (RWi) is closest to its "Low" terminal (RLi). When the WRi register of a DCP contains all ones (WRi[7:0]= FFh), its wiper terminal (RWi) is closest to its "High" terminal (RHi). As the value of the WRi increases from all zeroes (0) to all ones ( 255 decimal), the wiper moves monotonically from the position closest to RLi to the position closest to RHi. At the
same time, the resistance between RWi and RLi increases monotonically, while the resistance between RHi and RWi decreases monotonically.

While the ISL22343 is being powered up, the WRi is reset to 80h (128 decimal), which locates RWi roughly at the center between RLi and RHi. After the power supply voltage becomes large enough for reliable non-volatile memory reading, the WRi will be reloaded with the value stored in corresponding non-volatile Initial Value Register (IVRi).
The WRi and IVRi can be read or written to directly using the $I^{2} \mathrm{C}$ serial interface as described in the following sections.

## Memory Description

The ISL22343 contains four non-volatile 8-bit Initial Value Register (IVRi), eleven General Purpose non-volatile 8-bit registers and five volatile 8-bit registers: four Wiper Registers (WRi) and Access Control Register (ACR). Memory map of ISL22343 is in Table 1. The non-volatile registers (IVRi) at address $0,1,2$ and 3 contain initial wiper position and volatile registers (WRi) contain current wiper position.

TABLE 1. MEMORY MAP

| ADDRESS (hex) | NON-VOLATILE | VOLATILE |
| :---: | :---: | :---: |
| 10 | N/A | ACR |
| F | Reserved |  |
| E | General Purpose | N/A |
| D | General Purpose | N/A |
| C | General Purpose | N/A |
| B | General Purpose | N/A |
| A | General Purpose | N/A |
| 9 | General Purpose | N/A |
| 8 | General Purpose | N/A |
| 7 | General Purpose | N/A |
| 6 | General Purpose | N/A |
| 5 | General Purpose | N/A |
| 4 | General Purpose | N/A |
| 3 | IVR3 | WR3 |
| 2 | IVR2 | WR2 |
| 1 | IVR1 | WR1 |
| 0 | IVR0 | WRO |

The non-volatile IVRi and volatile WRi registers are accessible with the same address.
The Access Control Register (ACR) contains information and control bits described below in Table 2.

The VOL bit (ACR[7]) determines whether the access to wiper registers WRi or initial value registers IVRi.

TABLE 2. ACCESS CONTROL REGISTER (ACR)

| BIT \# | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NAME | VOL | $\overline{\text { SHDN }}$ | WIP | 0 | 0 | 0 | 0 | 0 |

If VOL bit is 0 , the non-volatile IVRi registers are accessible. If VOL bit is 1 , only the volatile WRi are accessible. Note: value is written to IVRi register also is written to the corresponding WRi. The default value of this bit is 0 .
The $\overline{\mathrm{SHDN}}$ bit (ACR[6]) disables or enables Shutdown mode. When this bit is 0 , DCPs are in Shutdown mode. Default value of the $\overline{\mathrm{SHDN}}$ bit is 1 .

FIGURE 15. DCP CONNECTION IN SHUTDOWN MODE
The WIP bit (ACR[5]) is a read-only bit. It indicates that nonvolatile write operation is in progress. It is impossible to write to the WRi or ACR while WIP bit is 1.

## $I^{2} C$ Serial Interface

The ISL22343 supports an $I^{2} \mathrm{C}$ bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL22343 operates as a slave device in all applications.
All communication over the $I^{2} \mathrm{C}$ interface is conducted by sending the MSB of each byte of data first.

## Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (See Figure 16). On power-up of the ISL22343, the SDA pin is in the input mode.
All $I^{2} \mathrm{C}$ interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL22343 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (See Figure 16). A START condition is ignored during the powerup of the device.
All I ${ }^{2}$ C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while

SCL is HIGH (See Figure 16). A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An ACK (Acknowledge) is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (See Figure 17).

The ISL22343 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL22343 also responds with an ACK after receiving a Data

Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation

A valid Identification Byte contains 1010 as four MSBs, and the following three bits matching the logic values present at pins A2, A1 and A0. The LSB is the Read/ $\overline{\text { Write }}$ bit. Its value is " 1 " for a Read operation and " 0 " for a Write operation (See Table 3).

TABLE 3. IDENTIFICATION BYTE FORMAT
LOGIC VALUES AT PINS A2, A1 AND A0, RESPECTIVELY

FIGURE 16. VALID DATA CHANGES, START AND STOP CONDITIONS

FIGURE 17. ACKNOWLEDGE RESPONSE FROM RECEIVER

FIGURE 18. BYTE WRITE SEQUENCE

FIGURE 19. READ SEQUENCE

## Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL22343 responds with an ACK. At this time, the device enters its standby state (See Figure 18).

The non-volatile write cycle starts after STOP condition is determined and it requires up to 20 ms delay for the next non-volatile write. Thus, non-volatile registers must be written individually.

## Read Operation

A Read operation consist of a three byte instruction followed by one or more Data Bytes (See Figure 19). The master initiates the operation issuing the following sequence: a START, the Identification byte with the R/W bit set to " 0 ", an Address Byte, a second START, and a second Identification byte with the R/W bit set to " 1 ". After each of the three bytes, the ISL22343 responds with an ACK. Then the ISL22343 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The Data Bytes are from the registers indicated by an internal pointer. This pointers initial value is determined by the Address Byte in the Read operation instruction, and increments by one during transmission of each Data Byte. After reaching the memory location 0Fh, the pointer "rolls over" to 00h, and the device continues to output data for each ACK received.The master terminates the read operation issuing a NACK ( $\overline{\mathrm{ACK}}$ ) and a STOP condition following the last bit of the last Data Byte (See Figure 19).

## Applications Information

When stepping up through each tap in voltage divider mode, some tap transition points can result in noticeable voltage transients (or overshoot/undershoot) resulting from the sudden transition from a very low impedance "make" to a much higher impedance "break within an extremely short period of time (<50ns). Two such code transitions are EFh to FOh, and OFh to 10h. Note that all switching transients will settle well within the settling time as stated on the datasheet. A small capacitor can be added externally to reduce the amplitude of these voltage transients, but that will also reduce the useful bandwidth of the circuit, thus this may not be a good solution for some applications. It may be a good idea, in that case, to use fast amplifiers in a signal chain for fast recovery.

## Application Example

Figure 20 shows an example of using ISL22343 for gain setting and offset correction in a high side current measurement application. DCPO applies a programmable offset voltage of $\pm 25 \mathrm{mV}$ to the FB+ pin of the Instrumentation Amplifier ISL28272 to adjust output offset to zero voltages. DCP1 programs the gain of the ISL28272 from 90 to 110 with 5 V output for 10 A current through current sense resistor. DCP2 and DCP3 are used for another channel of dual ISL28272 correspondently (not shown in Figure 20).

More application examples can be found at http://www.intersil.com/data/an/AN1145.pdf

NOTES:

1. Dimensioning and tolerancing conform to ASME Y14.5-1994.
2. N is the number of terminals.
3. Nd and Ne refer to the number of terminals on each D and E .
4. All dimensions are in millimeters. Angles are in degrees.
5. Dimension $b$ applies to the metallized terminal and is measured between 0.15 mm and 0.30 mm from the terminal tip.
6. The configuration of the pin \#1 identifier is optional, but must be located within the zone indicated. The pin \#1 identifier may be either a mold or mark feature.
7. Dimensions D2 and E2 are for the exposed pads which provide improved electrical and thermal performance.
8. Nominal dimensions are provided to assist with PCB Land Pattern Design efforts, see Intersil Technical Brief TB389.
9. Features and dimensions $A 2, A 3, D 1, E 1, P \& \theta$ are present when Anvil singulation method is used and not present for saw singulation.
10. Compliant to JEDEC MO-220VHHC Issue I except for the "b" dimension.

Thin Shrink Small Outline Plastic Packages (TSSOP)

## NOTES:

1. These package dimensions are within allowable dimensions of JEDEC MO-153-AC, Issue E.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15 mm (0.006 inch) per side.
4. Dimension "E1" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.15 mm ( 0.006 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " L " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08 mm ( 0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07 mm ( 0.0027 inch ).
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact. (Angles in degrees)
