

# M24C16, M24C08 M24C04, M24C02, M24C01

16Kbit, 8Kbit, 4Kbit, 2Kbit and 1Kbit Serial I<sup>2</sup>C Bus EEPROM

## FEATURES SUMMARY

- Two-Wire I<sup>2</sup>C Serial Interface  
Supports 400kHz Protocol
- Single Supply Voltage:
  - 2.5 to 5.5V for M24Cxx-W
  - 1.8 to 5.5V for M24Cxx-R
- Write Control Input
- BYTE and PAGE WRITE (up to 16 Bytes)
- RANDOM and SEQUENTIAL READ Modes
- Self-Timed Programming Cycle
- Automatic Address Incrementing
- Enhanced ESD/Latch-Up Protection
- More than 1 Million Erase/Write Cycles
- More than 40-Year Data Retention
- Packages
  - ECOPACK® (RoHS compliant)

## SUMMARY DESCRIPTION

These I<sup>2</sup>C-compatible electrically erasable programmable memory (EEPROM) devices are organized as 2048/1024/512/256/128 x 8 (M24C16, M24C08, M24C04, M24C02 and M24C01).

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages.

ECOPACK® packages are Lead-free and RoHS compliant.

ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).

I<sup>2</sup>C uses a two-wire serial interface, comprising a bi-directional data line and a clock line. The devices carry a built-in 4-bit Device Type Identifier code (1010) in accordance with the I<sup>2</sup>C bus definition.

The device behaves as a slave in the I<sup>2</sup>C protocol, with all memory operations synchronized by the serial clock. Read and Write operations are initiated by a Start condition, generated by the bus master. The Start condition is followed by a Device Select Code and Read/Write bit (RW) (as described in Table 3.), terminated by an acknowledge bit.

When writing data to the memory, the device inserts an acknowledge bit during the 9<sup>th</sup> bit time, following the bus master's 8-bit transmission. When data is read by the bus master, the bus master acknowledges the receipt of the data byte in the same way. Data transfers are terminated by a Stop condition after an Ack for Write, and after a NoAck for Read.

## SIGNAL DESCRIPTION

### Serial Clock (SCL)

This input signal is used to strobe all data in and out of the device. In applications where this signal is used by slave devices to synchronize the bus to a slower clock, the bus master must have an open drain output, and a pull-up resistor can be connected from Serial Clock (SCL) to  $V_{CC}$ . (Figure 5. indicates how the value of the pull-up resistor can be calculated). In most applications, though, this method of synchronization is not employed, and so the pull-up resistor is not necessary, provided that the bus master has a push-pull (rather than open drain) output.

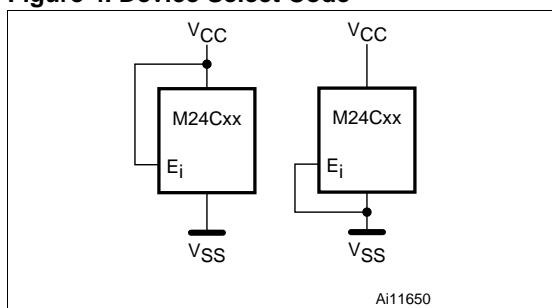

### Serial Data (SDA)

This bi-directional signal is used to transfer data in or out of the device. It is an open drain output that may be wire-OR'ed with other open drain or open collector signals on the bus. A pull up resistor must be connected from Serial Data (SDA) to  $V_{CC}$ . (Figure 5. indicates how the value of the pull-up resistor can be calculated).

### Chip Enable (E0, E1, E2)

These input signals are used to set the value that is to be looked for on the three least significant bits (b3, b2, b1) of the 7-bit Device Select Code. These inputs must be tied to  $V_{CC}$  or  $V_{SS}$ , to establish the Device Select Code as shown in Figure 4.

Figure 4. Device Select Code

**Write Control ( $\overline{WC}$ ).** This input signal is useful for protecting the entire contents of the memory from inadvertent write operations. Write operations are disabled to the entire memory array when Write Control ( $\overline{WC}$ ) is driven High. When unconnected, the signal is internally read as  $V_{IL}$ , and Write operations are allowed.

When Write Control ( $\overline{WC}$ ) is driven High, Device Select and Address bytes are acknowledged, Data bytes are not acknowledged.

### Supply voltage ( $V_{CC}$ )

**Operating supply voltage  $V_{CC}$ .** Prior to selecting the memory and issuing instructions to it, a valid and stable  $V_{CC}$  voltage must be applied: this voltage must be a DC voltage within the specified [ $V_{CC}(\min)$ ,  $V_{CC}(\max)$ ] range, as defined in Table 6. and Table 7. In order to secure a stable DC supply voltage, it is recommended to decouple the  $V_{CC}$  line with a suitable capacitor (usually of the order of 10nF to 100nF) close to the  $V_{CC}/V_{SS}$  package pins.

The  $V_{CC}$  voltage must remain stable and valid until the end of the transmission of the instruction and, for a Write instruction, until the completion of the internal write cycle ( $t_w$ ).

**Internal Device Reset.** In order to prevent inadvertent Write operations during Power-up, a Power On Reset (POR) circuit is included. At Power-up (continuous rise of  $V_{CC}$ ), the device does not respond to any instruction until  $V_{CC}$  has reached the Power On Reset threshold voltage (this threshold is lower than the minimum  $V_{CC}$  operating voltage defined in Table 6. and Table 7.).

When  $V_{CC}$  has passed the POR threshold, the device is reset and in the Standby Power mode

**Power-down.** At Power-down (where  $V_{CC}$  decreases continuously), as soon as  $V_{CC}$  drops from the operating voltage range below the Power On Reset threshold voltage, the device stops responding to any instruction sent to it.

During Power-down, the device must be deselected and in the Standby Power cycle mode (that is there should be no internal Write cycle in progress).

Figure 5. Maximum RP Value versus Bus Parasitic Capacitance (C) for an I<sup>2</sup>C Bus

Figure 6. I<sup>2</sup>C Bus Protocol

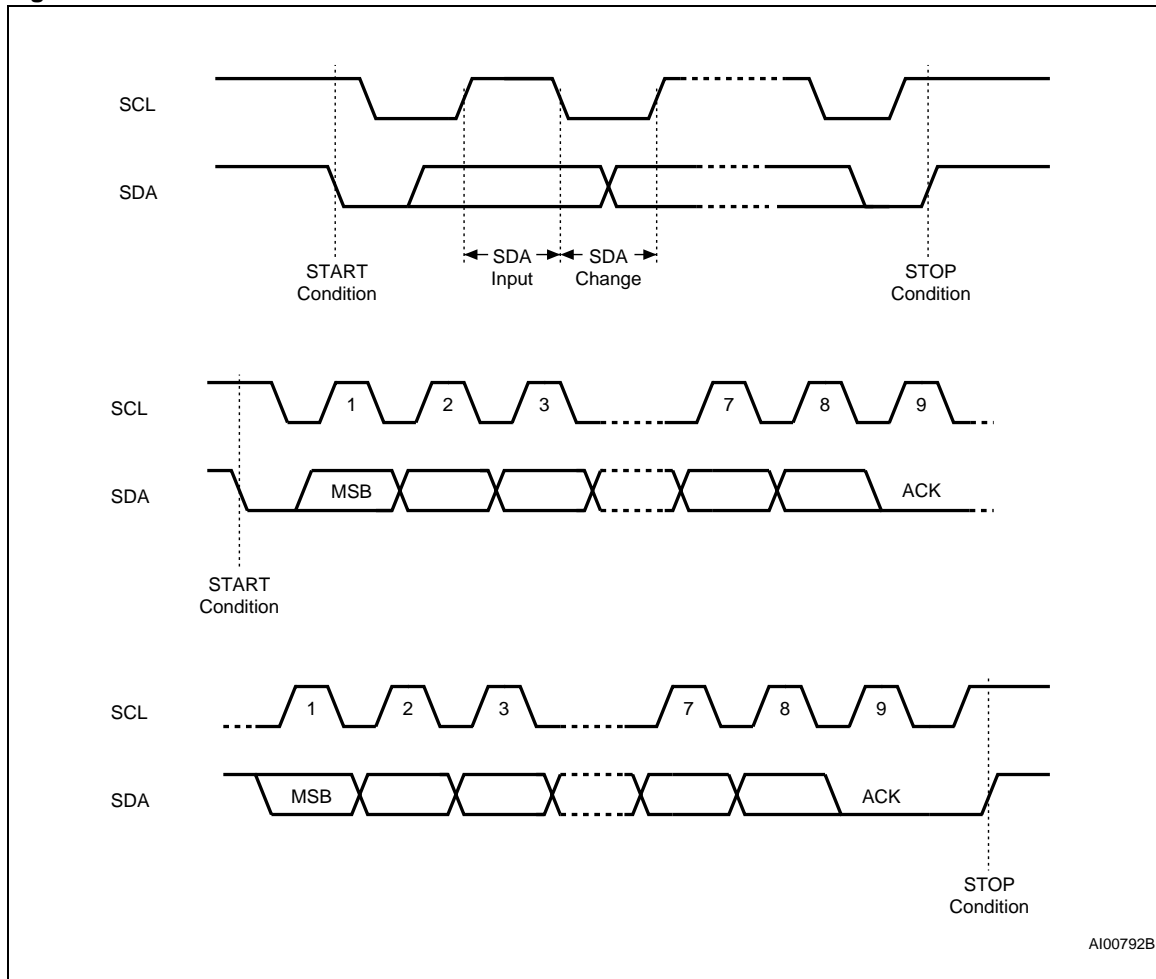

Table 3. Device Select Code

	Device Type Identifier <sup>1</sup>				Chip Enable <sup>2,3</sup>			R $\bar{W}$
	b7	b6	b5	b4	b3	b2	b1	b0
M24C01 Select Code	1	0	1	0	E2	E1	E0	R $\bar{W}$
M24C02 Select Code	1	0	1	0	E2	E1	E0	R $\bar{W}$
M24C04 Select Code	1	0	1	0	E2	E1	A8	R $\bar{W}$
M24C08 Select Code	1	0	1	0	E2	A9	A8	R $\bar{W}$
M24C16 Select Code	1	0	1	0	A10	A9	A8	R $\bar{W}$

Note: 1. The most significant bit, b7, is sent first.  
 2. E0, E1 and E2 are compared against the respective external pins on the memory device.  
 3. A10, A9 and A8 represent most significant bits of the address.

### DEVICE OPERATION

The device supports the I<sup>2</sup>C protocol. This is summarized in [Figure 6](#). Any device that sends data on to the bus is defined to be a transmitter, and any device that reads the data to be a receiver. The device that controls the data transfer is known as the bus master, and the other as the slave device. A data transfer can only be initiated by the bus master, which will also provide the serial clock for synchronization. The M24Cxx device is always a slave in all communication.

#### Start Condition

Start is identified by a falling edge of Serial Data (SDA) while Serial Clock (SCL) is stable in the High state. A Start condition must precede any data transfer command. The device continuously monitors (except during a Write cycle) Serial Data (SDA) and Serial Clock (SCL) for a Start condition, and will not respond unless one is given.

#### Stop Condition

Stop is identified by a rising edge of Serial Data (SDA) while Serial Clock (SCL) is stable and driven High. A Stop condition terminates communication between the device and the bus master. A Read command that is followed by NoAck can be followed by a Stop condition to force the device into the Stand-by mode. A Stop condition at the end of a Write command triggers the internal Write cycle.

#### Acknowledge Bit (ACK)

The acknowledge bit is used to indicate a successful byte transfer. The bus transmitter, whether it be bus master or slave device, releases Serial Data (SDA) after sending eight bits of data. During the 9<sup>th</sup> clock pulse period, the receiver pulls Serial Data (SDA) Low to acknowledge the receipt of the eight data bits.

#### Data Input

During data input, the device samples Serial Data (SDA) on the rising edge of Serial Clock (SCL).

For correct device operation, Serial Data (SDA) must be stable during the rising edge of Serial Clock (SCL), and the Serial Data (SDA) signal must change *only* when Serial Clock (SCL) is driven Low.

#### Memory Addressing

To start communication between the bus master and the slave device, the bus master must initiate a Start condition. Following this, the bus master sends the Device Select Code, shown in [Table 3](#). (on Serial Data (SDA), most significant bit first).

The Device Select Code consists of a 4-bit Device Type Identifier, and a 3-bit Chip Enable "Address" (E2, E1, E0). To address the memory array, the 4-bit Device Type Identifier is 1010b.

Each device is given a unique 3-bit code on the Chip Enable (E0, E1, E2) inputs. When the Device Select Code is received, the device only responds if the Chip Enable Address is the same as the value on the Chip Enable (E0, E1, E2) inputs. However, those devices with larger memory capacities (the M24C16, M24C08 and M24C04) need more address bits. E0 is not available for use on devices that need to use address line A8; E1 is not available for devices that need to use address line A9, and E2 is not available for devices that need to use address line A10 (see [Figure 3](#), and [Table 3](#) for details). Using the E0, E1 and E2 inputs, up to eight M24C02 (or M24C01), four M24C04, two M24C08 or one M24C16 devices can be connected to one I<sup>2</sup>C bus. In each case, and in the hybrid cases, this gives a total memory capacity of 16 Kbits, 2 KBytes (except where M24C01 devices are used).

The 8<sup>th</sup> bit is the Read/ $\overline{\text{Write}}$  bit ( $\overline{\text{RW}}$ ). This bit is set to 1 for Read and 0 for Write operations.

If a match occurs on the Device Select code, the corresponding device gives an acknowledgment on Serial Data (SDA) during the 9<sup>th</sup> bit time. If the device does not match the Device Select code, it deselects itself from the bus, and goes into Stand-by mode.

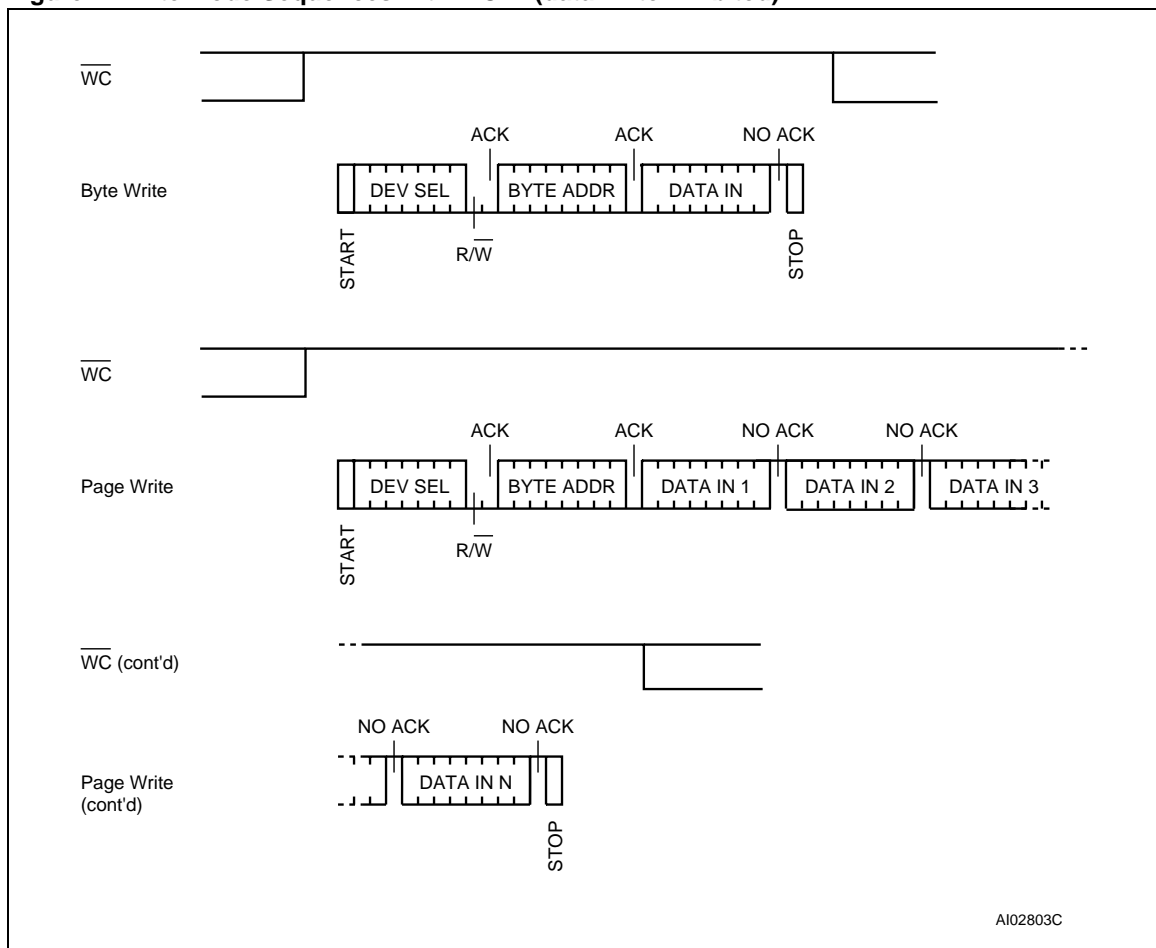

Table 4. Operating Modes

Mode	R $\bar{W}$ bit	$\overline{WC}$ (1)	Bytes	Initial Sequence
Current Address Read	1	X	1	START, Device Select, R $\bar{W}$ = 1
Random Address Read	0	X	1	START, Device Select, R $\bar{W}$ = 0, Address
	1	X		reSTART, Device Select, R $\bar{W}$ = 1
Sequential Read	1	X	$\geq 1$	Similar to Current or Random Address Read
Byte Write	0	V <sub>IL</sub>	1	START, Device Select, R $\bar{W}$ = 0
Page Write	0	V <sub>IL</sub>	$\leq 16$	START, Device Select, R $\bar{W}$ = 0

Note: 1. X = V<sub>IH</sub> or V<sub>IL</sub>.

Figure 7. Write Mode Sequences with  $\overline{WC}=1$  (data write inhibited)

### Write Operations

Following a Start condition the bus master sends a Device Select Code with the Read/Write bit (RW) reset to 0. The device acknowledges this, as shown in [Figure 8.](#), and waits for an address byte. The device responds to the address byte with an acknowledge bit, and then waits for the data byte.

When the bus master generates a Stop condition immediately after the Ack bit (in the “10<sup>th</sup> bit” time slot), either at the end of a Byte Write or a Page Write, the internal Write cycle is triggered. A Stop condition at any other time slot does not trigger the internal Write cycle.

During the internal Write cycle, Serial Data (SDA) and Serial Clock (SCL) are ignored, and the device does not respond to any requests.

### Byte Write

After the Device Select code and the address byte, the bus master sends one data byte. If the addressed location is Write-protected, by Write Control (WC) being driven High (during the period from the Start condition until the end of the address byte), the device replies to the data byte with NoAck, as shown in [Figure 7.](#), and the location is not modified. If, instead, the addressed location is not Write-protected, the device replies with Ack. The bus master terminates the transfer by generating a Stop condition, as shown in [Figure 8.](#)

### Page Write

The Page Write mode allows up to 16 bytes to be written in a single Write cycle, provided that they are all located in the same page in the memory: that is, the most significant memory address bits are the same. If more bytes are sent than will fit up to the end of the page, a condition known as ‘roll-over’ occurs. This should be avoided, as data starts to become overwritten in an implementation dependent way.

The bus master sends from 1 to 16 bytes of data, each of which is acknowledged by the device if Write Control (WC) is Low. If the addressed location is Write-protected, by Write Control (WC) being driven High (during the period from the Start condition until the end of the address byte), the device replies to the data bytes with NoAck, as shown in [Figure 7.](#), and the locations are not modified. After each byte is transferred, the internal byte address counter (the 4 least significant address bits only) is incremented. The transfer is terminated by the bus master generating a Stop condition.

Figure 8. Write Mode Sequences with  $\overline{WC}=0$  (data write enabled)

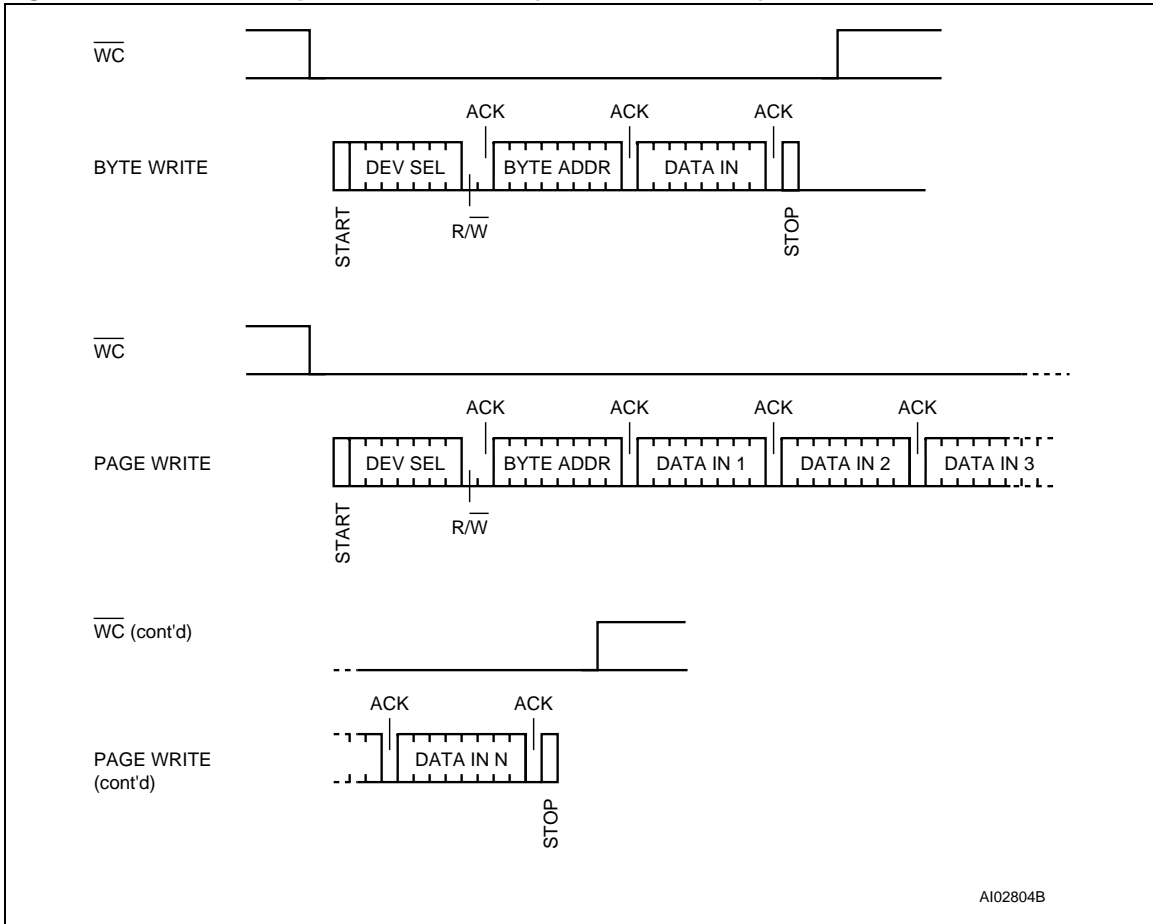

Figure 9. Write Cycle Polling Flowchart using ACK

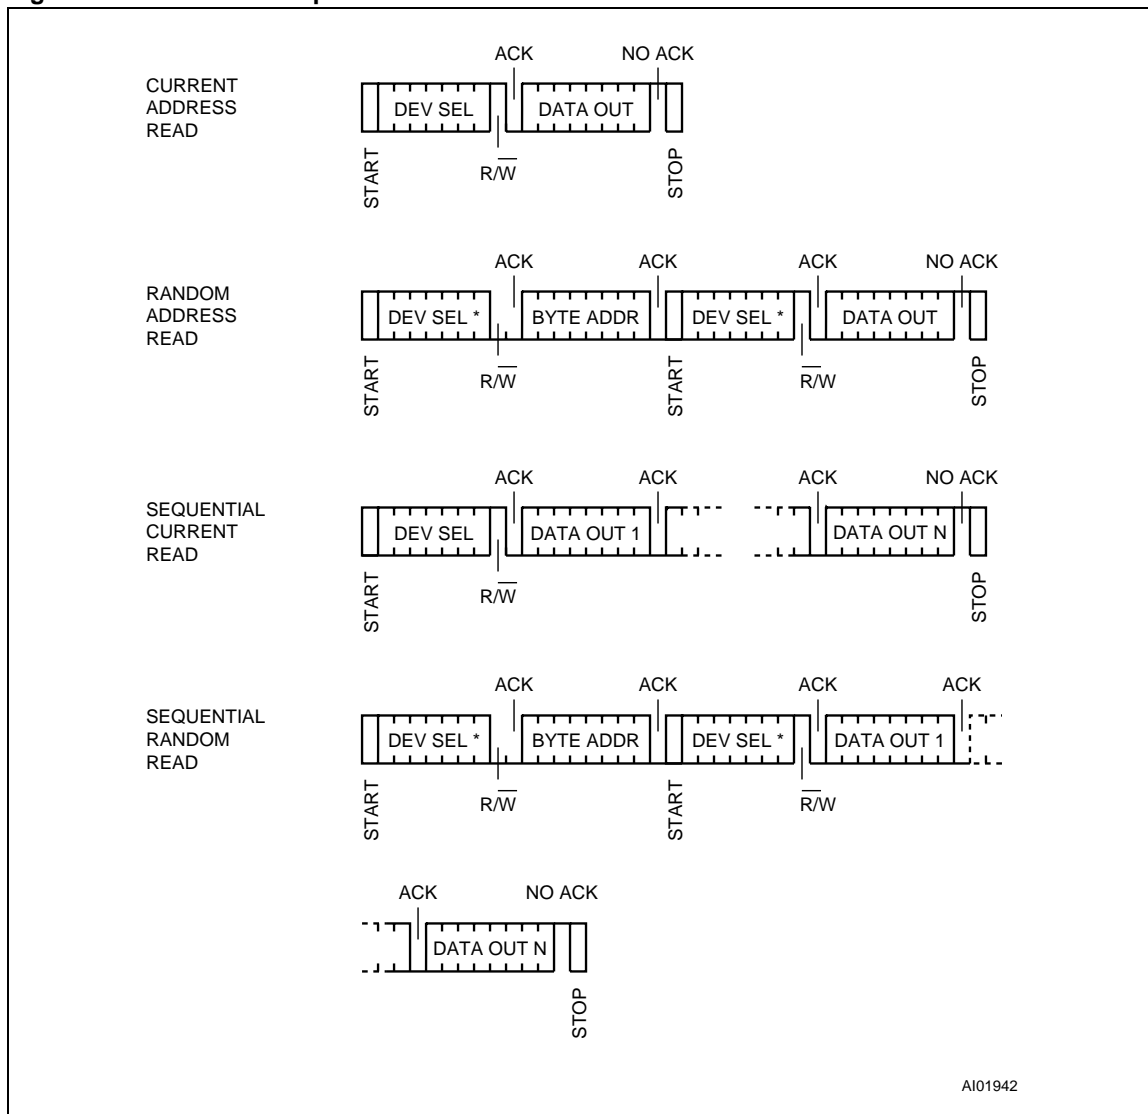

### Minimizing System Delays by Polling On ACK

During the internal Write cycle, the device disconnects itself from the bus, and writes a copy of the data from its internal latches to the memory cells. The maximum Write time ( $t_w$ ) is shown in [Table 13](#), and [Table 14](#), but the typical time is shorter. To make use of this, a polling sequence can be used by the bus master.

The sequence, as shown in [Figure 9](#), is:

- Initial condition: a Write cycle is in progress.
- Step 1: the bus master issues a Start condition followed by a Device Select Code (the first byte of the new instruction).
- Step 2: if the device is busy with the internal Write cycle, no Ack will be returned and the bus master goes back to Step 1. If the device has terminated the internal Write cycle, it responds with an Ack, indicating that the device is ready to receive the second part of the instruction (the first byte of this instruction having been sent during Step 1).

Figure 10. Read Mode Sequences

Note: The seven most significant bits of the Device Select Code of a Random Read (in the 1<sup>st</sup> and 3<sup>rd</sup> bytes) must be identical.

### Read Operations

Read operations are performed independently of the state of the Write Control ( $\overline{WC}$ ) signal.

The device has an internal address counter which is incremented each time a byte is read.

### Random Address Read

A dummy Write is first performed to load the address into this address counter (as shown in Figure 10.) but *without* sending a Stop condition. Then, the bus master sends another Start condition, and repeats the Device Select Code, with the Read/Write bit (RW) set to 1. The device acknowl-

edges this, and outputs the contents of the addressed byte. The bus master must *not* acknowledge the byte, and terminates the transfer with a Stop condition.

### Current Address Read

For the Current Address Read operation, following a Start condition, the bus master only sends a Device Select Code with the Read/Write bit (RW) set to 1. The device acknowledges this, and outputs the byte addressed by the internal address counter. The counter is then incremented. The bus master terminates the transfer with a Stop condi-

tion, as shown in [Figure 10.](#), *without* acknowledging the byte.

### Sequential Read

This operation can be used after a Current Address Read or a Random Address Read. The bus master *does* acknowledge the data byte output, and sends additional clock pulses so that the device continues to output the next byte in sequence. To terminate the stream of bytes, the bus master must *not* acknowledge the last byte, and *must* generate a Stop condition, as shown in [Figure 10.](#)

The output data comes from consecutive addresses, with the internal address counter automatically incremented after each byte output. After the last memory address, the address counter 'rolls-over',

and the device continues to output data from memory address 00h.

### Acknowledge in Read Mode

For all Read commands, the device waits, after each byte read, for an acknowledgment during the 9<sup>th</sup> bit time. If the bus master does not drive Serial Data (SDA) Low during this time, the device terminates the data transfer and switches to its Standby mode.

### INITIAL DELIVERY STATE

The device is delivered with all bits in the memory array set to 1 (each byte contains FFh).

## MAXIMUM RATING

Stressing the device outside the ratings listed in [Table 5](#). may cause permanent damage to the device. These are stress ratings only, and operation of the device at these, or any other conditions outside those indicated in the Operating sections of

this specification, is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 5. Absolute Maximum Ratings**

Symbol	Parameter	Min.	Max.	Unit
$T_A$	Ambient Operating Temperature	-40	130	°C
$T_{STG}$	Storage Temperature	-65	150	°C
$T_{LEAD}$	PDIP-Specific Lead Temperature during Soldering		260 <sup>(1)</sup>	°C
$V_{IO}$	Input or Output range	-0.50	6.5	V
$V_{CC}$	Supply Voltage	-0.50	6.5	V
$V_{ESD}$	Electrostatic Discharge Voltage (Human Body model) <sup>(2)</sup>	-4000	4000	V

Note: 1.  $T_{LEAD}$  max must not be applied for more than 10s.

2. AEC-Q100-002 (compliant with JEDEC Std JESD22-A114A, C1=100pF, R1=1500Ω, R2=500Ω).

## DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measure-

ment Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

**Table 6. Operating Conditions (M24Cxx-W)**

Symbol	Parameter	Min.	Max.	Unit
$V_{CC}$	Supply Voltage	2.5	5.5	V
$T_A$	Ambient Operating Temperature (Device Grade 6)	-40	85	°C
	Ambient Operating Temperature (Device Grade 3)	-40	125	°C

**Table 7. Operating Conditions (M24Cxx-R)**

Symbol	Parameter	Min.	Max.	Unit
$V_{CC}$	Supply Voltage	1.8	5.5	V
$T_A$	Ambient Operating Temperature	-40	85	°C

**Table 8. DC Characteristics (M24Cxx-W, Device Grade 6)**

Symbol	Parameter	Test Condition (in addition to those in Table 6.)	Min.	Max.	Unit
$I_{LI}$	Input Leakage Current (SCL, SDA, E0, E1, and E2)	$V_{IN} = V_{SS}$ or $V_{CC}$		± 2	µA
$I_{LO}$	Output Leakage Current	$V_{OUT} = V_{SS}$ or $V_{CC}$ , SDA in Hi-Z		± 2	µA
$I_{CC}$	Supply Current	$V_{CC}=5V$ , $f_c=400kHz$ (rise/fall time < 30ns)		2	mA
		$V_{CC}=2.5V$ , $f_c=400kHz$ (rise/fall time < 30ns)		1	mA
$I_{CC1}$	Stand-by Supply Current	$V_{IN} = V_{SS}$ or $V_{CC}$ , for $2.5V < V_{CC} < 5.5V$		1	µA
$V_{IL}$	Input Low Voltage <sup>(1)</sup>		-0.45	$0.3V_{CC}$	V
$V_{IH}$	Input High Voltage <sup>(1)</sup>		$0.7V_{CC}$	$V_{CC}+1$	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 2.1mA$ when $V_{CC} = 2.5V$ or $I_{OL} = 3mA$ when $V_{CC} = 5.5V$		0.4	V

Note: 1. The voltage source driving only E0, E1 and E2 inputs must provide an impedance of less than 1kOhm.

Table 9. DC Characteristics (M24Cxx-W, Device Grade 3)

Symbol	Parameter	Test Condition (in addition to those in Table 6.)	Min.	Max.	Unit
$I_{LI}$	Input Leakage Current (SCL, SDA, E0, E1, and E2)	$V_{IN} = V_{SS}$ or $V_{CC}$		$\pm 2$	$\mu A$
$I_{LO}$	Output Leakage Current	$V_{OUT} = V_{SS}$ or $V_{CC}$ , SDA in Hi-Z		$\pm 2$	$\mu A$
$I_{CC}$	Supply Current	$V_{CC}=5V$ , $f_c=400kHz$ (rise/fall time < 30ns)		3	mA
		$V_{CC}=2.5V$ , $f_c=400kHz$ (rise/fall time < 30ns)		3	mA
$I_{CC1}$	Stand-by Supply Current	$V_{IN} = V_{SS}$ or $V_{CC}$ , $V_{CC} = 5 V$		5	$\mu A$
		$V_{IN} = V_{SS}$ or $V_{CC}$ , $V_{CC} = 2.5 V$		2	$\mu A$

Figure 11. AC Measurement I/O Waveform

Table 12. Input Parameters

Symbol	Parameter <sup>1,2</sup>	Test Condition	Min.	Max.	Unit
$C_{IN}$	Input Capacitance (SDA)			8	pF
$C_{IN}$	Input Capacitance (other pins)			6	pF
$Z_{WCL}$	$\overline{WC}$ Input Impedance	$V_{IN} < 0.3 V$	15	70	k $\Omega$
$Z_{WCH}$	$\overline{WC}$ Input Impedance	$V_{IN} > 0.7V_{CC}$	500		k $\Omega$
$t_{NS}$	Pulse width ignored (Input Filter on SCL and SDA)	Single glitch		100	ns

Note: 1.  $T_A = 25^\circ C$ ,  $f = 400kHz$   
 2. Sampled only, not 100% tested.

Table 13. AC Characteristics (M24Cxx-W)

Test conditions specified in Table 6. and Table 11.					
Symbol	Alt.	Parameter	Min.	Max.	Unit
$f_c$	$f_{SCL}$	Clock Frequency		400	kHz
$t_{CHCL}$	$t_{HIGH}$	Clock Pulse Width High	600		ns
$t_{CLCH}$	$t_{LOW}$	Clock Pulse Width Low	1300		ns
$t_{DL1DL2}^2$	$t_F$	SDA Fall Time	20	300	ns
$t_{DXCX}$	$t_{SU:DAT}$	Data In Set Up Time	100		ns
$t_{CLDX}$	$t_{HD:DAT}$	Data In Hold Time	0		ns
$t_{CLQX}$	$t_{DH}$	Data Out Hold Time	200		ns
$t_{CLQV}^3$	$t_{AA}$	Clock Low to Next Data Valid (Access Time)	200	900	ns
$t_{CHDX}^1$	$t_{SU:STA}$	Start Condition Set Up Time	600		ns
$t_{DLCL}$	$t_{HD:STA}$	Start Condition Hold Time	600		ns
$t_{CHDH}$	$t_{SU:STO}$	Stop Condition Set Up Time	600		ns
$t_{DHDL}$	$t_{BUF}$	Time between Stop Condition and Next Start Condition	1300		ns
$t_W^4$	$t_{WR}$	Write Time		5	ms

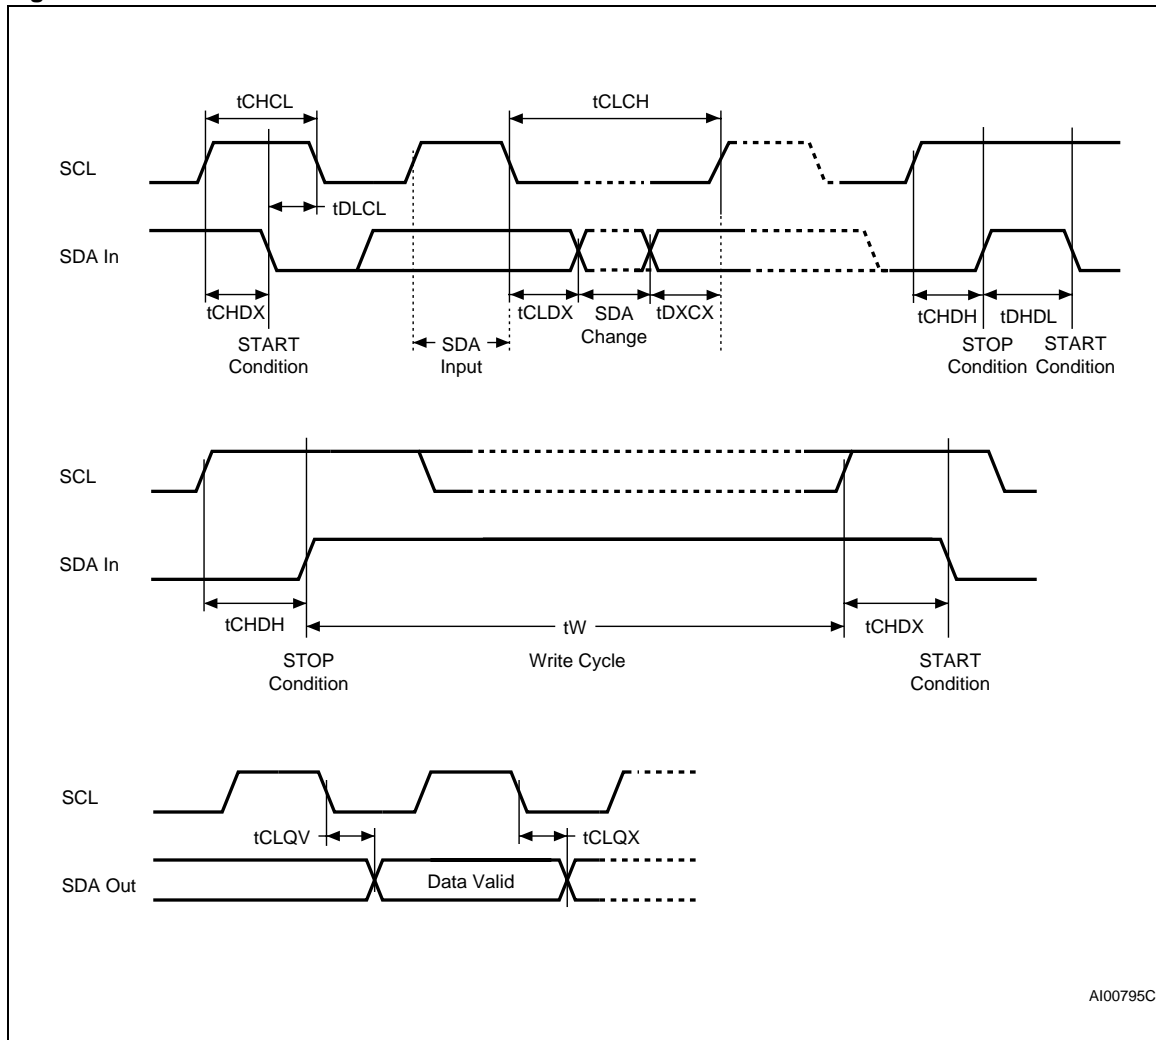

Note: 1. For a reSTART condition, or following a Write cycle.  
 2. Sampled only, not 100% tested.  
 3. To avoid spurious START and STOP conditions, a minimum delay is placed between SCL=1 and the falling or rising edge of SDA.  
 4. Previous devices bearing the process letter "L" in the package marking guarantee a maximum write time of 10ms. For more information about these devices and their device identification, please ask your ST Sales Office for Process Change Notices PCN MPG/EE/0061 and 0062 (PCEE0061 and PCEE0062).

Table 14. AC Characteristics (M24Cxx-R)

Test conditions specified in Table 7. and Table 10.					
Symbol	Alt.	Parameter	Min. <sup>4</sup>	Max. <sup>4</sup>	Unit
$f_c$	$f_{SCL}$	Clock Frequency		400	kHz
$t_{CHCL}$	$t_{HIGH}$	Clock Pulse Width High	600		ns
$t_{CLCH}$	$t_{LOW}$	Clock Pulse Width Low	1300		ns
$t_{DL1DL2}^2$	$t_F$	SDA Fall Time	20	300	ns
$t_{DXCX}$	$t_{SU:DAT}$	Data In Set Up Time	100		ns
$t_{CLDX}$	$t_{HD:DAT}$	Data In Hold Time	0		ns
$t_{CLQX}$	$t_{DH}$	Data Out Hold Time	200		ns
$t_{CLQV}^3$	$t_{AA}$	Clock Low to Next Data Valid (Access Time)	200	900	ns
$t_{CHDX}^1$	$t_{SU:STA}$	Start Condition Set Up Time	600		ns
$t_{DLCL}$	$t_{HD:STA}$	Start Condition Hold Time	600		ns
$t_{CHDH}$	$t_{SU:STO}$	Stop Condition Set Up Time	600		ns
$t_{DHDL}$	$t_{BUF}$	Time between Stop Condition and Next Start Condition	1300		ns
$t_W$	$t_{WR}$	Write Time		10	ms

Note: 1. For a reSTART condition, or following a Write cycle.  
 2. Sampled only, not 100% tested.  
 3. To avoid spurious START and STOP conditions, a minimum delay is placed between SCL=1 and the falling or rising edge of SDA.  
 4. This is preliminary information.

**PART NUMBERING**

**Table 20. Ordering Information Scheme**

Example:	M24C16	-	W	DW	3	T	P	/W
<b>Device Type</b>								
M24 = I <sup>2</sup> C serial access EEPROM								
<b>Device Function</b>								
16 = 16 Kbit (2048 x 8)								
08 = 8 Kbit (1024 x 8)								
04 = 4 Kbit (512 x 8)								
02 = 2 Kbit (256 x 8)								
01 = 1 Kbit (128 x 8)								
<b>Operating Voltage</b>								
W = V <sub>CC</sub> = 2.5 to 5.5V (400 kHz)								
R = V <sub>CC</sub> = 1.8 to 5.5V (400 kHz)								
<b>Package</b>								
BN = PDIP8								
MN = SO8 (150 mil width)								
MB = UDFDFPN8 (MLP8)								
DW = TSSOP8 (169 mil width)								
DS = TSSOP8 (3x3mm <sup>2</sup> body size, MSOP8)								
<b>Device Grade</b>								
6 = Industrial temperature range, -40 to 85 °C. Device tested with standard test flow								
3 = Device tested with High Reliability Certified Flow <sup>1</sup> . Automotive temperature range (-40 to 125 °C)								
<b>Option</b>								
T = Tape and Reel Packing								
<b>Plating Technology</b>								
blank = Standard SnPb plating								
P or G = ECOPACK® (RoHS compliant)								
<b>Process<sup>2</sup></b>								
/W or /S = F6SP36%								

Note: 1. ST strongly recommends the use of the Automotive Grade devices for use in an automotive environment. The High Reliability Certified Flow (HRCF) is described in the quality note QNEE9801. Please ask your nearest ST sales office for a copy.  
2. Used only for Device Grade 3.

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST Sales Office.

The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

## REVISION HISTORY

**Table 21. Document Revision History**

Date	Version	Description of Revision
10-Dec-1999	2.4	TSSOP8 Turned-Die package removed (p 2 and order information) Lead temperature added for TSSOP8 in table 2
18-Apr-2000	2.5	Labelling change to Fig-2D, correction of values for 'E' and main caption for Tab-13
05-May-2000	2.6	Extra labelling to Fig-2D
23-Nov-2000	3.0	SBGA package information removed to an annex document -R range changed to being the -S range, and the new -R range added
19-Feb-2001	3.1	SBGA package information put back in this document Lead Soldering Temperature in the Absolute Maximum Ratings table amended Write Cycle Polling Flow Chart using ACK illustration updated References to PSDIP changed to PDIP and Package Mechanical data updated Wording brought in to line with standard glossary
20-Apr-2001	3.2	Revision of DC and AC characteristics for the -S series
08-Oct-2001	3.3	Ball numbers added to the SBGA connections and package mechanical illustrations
09-Nov-2001	3.4	Specification of Test Condition for Leakage Currents in the DC Characteristics table improved
30-Jul-2002	3.5	Document reformatted using new template. SBGA5 package removed TSSOP8 (3x3mm <sup>2</sup> body size) package (MSOP8) added. -L voltage range added
04-Feb-2003	3.6	Document title spelt out more fully. "W"-marked devices with tw=5ms added.
05-May-2003	3.7	-R voltage range upgraded to 400kHz working, and no longer preliminary data. 5V voltage range at temperature range 3 (-xx3) no longer preliminary data. -S voltage range removed. -Wxx3 voltage+temp ranged added as preliminary data.
07-Oct-2003	4.0	Table of contents, and Pb-free options added. Minor wording changes in Summary Description, Power-On Reset, Memory Addressing, Read Operations. $V_{IL}(\min)$ improved to -0.45V. $t_W(\max)$ value for -R voltage range corrected.
17-Mar-2004	5.0	MLP package added. Absolute Maximum Ratings for $V_{IO}(\min)$ and $V_{CC}(\min)$ changed. Soldering temperature information clarified for RoHS compliant devices. Device grade information clarified. Process identification letter "G" information added. 2.2-5.5V range is removed, and 4.5-5.5V range is now Not for New Design
7-Oct-2005	6.0	Product List summary table added. AEC-Q100-002 compliance. Device Grade informaton clarified. Updated <a href="#">Device internal reset</a> section, <a href="#">Figure 4.</a> , <a href="#">Figure 5.</a> , <a href="#">Table 14.</a> and <a href="#">Table 20.</a> Added Ecopack® information. Updated tW=5ms for the M24Cxx-W.
17-Jan-2006	7.0	Pin numbers removed from silhouettes (see <a href="#">Figure 1., Packages</a> ). <a href="#">Internal Device Reset</a> paragraph moved to below <a href="#">Supply voltage (V<sub>CC</sub>)</a> . <a href="#">Supply voltage (V<sub>CC</sub>)</a> added below <a href="#">SIGNAL DESCRIPTION</a> . Test conditions for $V_{OL}$ updated in <a href="#">Table 8.</a> and <a href="#">Table 9.</a> SO8N package specifications updated (see <a href="#">Table 16.</a> ) New definition of $I_{CC1}$ over the whole $V_{CC}$ range (see <a href="#">Tables 8, 9 and 10</a> ).
