

# STK14D88 32Kx8 AutoStore nvSRAM

### Features

- 25, 35, 45 ns Read Access and R/W Cycle Time
- Unlimited Read/Write Endurance
- Automatic Nonvolatile STORE on Power Loss
- Nonvolatile STORE Under Hardware or Software Control
- Automatic RECALL to SRAM on Power Up
- Unlimited RECALL Cycles
- 200K STORE Cycles
- 20-Year Nonvolatile Data Retention
- Single 3.0V +20%, -10% Power Supply
- Commercial, Industrial Temperatures
- Small Footprint SOIC and SSOP Packages (RoHS-Compliant)

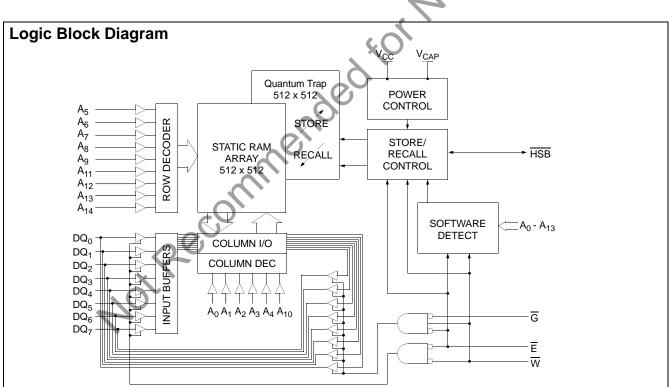

### Description

The Cypress STK14D88 is a 256Kb fast static RAM with a nonvolatile Quantum Trap storage element included with each memory cell.

The SRAM provides fast access and cycle times, ease of use, and unlimited read and write endurance of a normal SRAM.

Data transfers automatically to the nonvolatile storage cells when power loss is detected (the STORE operation). On power up, data is automatically restored to the SRAM (the RECALL operation). Both STORE and RECALL operations are also available under software control.

The Cypress nvSRAM is the first monolithic nonvolatile memory to offer unlimited writes and reads. It is the highest performance, most reliable nonvolatile memory available.

# **Pin Configurations**

#### Figure 1. Pin Diagram 48-Pin SSOP/32-SOIC

### **Pin Descriptions**

Pin Name	I/O	Description
A <sub>14</sub> -A <sub>0</sub>	Input	Address: The 15 address inputs select one of 32,768 bytes in the nvSRAM array
DQ <sub>7</sub> -DQ <sub>0</sub>	I/O	Data: Bi-directional 8-bit data bus for accessing the nvSRAM
Ē	Input	Chip Enable: The active low $\overline{E}$ input selects the device
W	Input	Write Enable: The active low $\overline{W}$ enables data on the DQ pins to be written to the address location latched by the falling edge of $\overline{E}$
G	Input	<b>Output Enable</b> : The active low $\overline{G}$ input enables the data output buffers during read cycles. De-asserting $\overline{G}$ high caused the DQ pins to tri-state.
V <sub>CC</sub>	Power Supply	<b>Power</b> : 3.0V, +20%, -10%
HSB	I/O	<b>Hardware Store Busy</b> : When low this output indicates a Store is in progress. When pulled low external to the chip, it initiates a nonvolatile STORE operation. A weak pull up resistor keeps this pin high if not connected. (Connection Optional).
V <sub>CAP</sub>	Power Supply	AutoStore Capacitor: Supplies power to nvSRAM during power loss to store data from SRAM to nonvolatile storage elements.
V <sub>SS</sub>	Power Supply	Ground
NC	No Connect	Unlabeled pins have no internal connections.

#### Note

1. See "Package Diagrams" on page 16 for detailed package size specifications.

## **Absolute Maximum Ratings**

Voltage on Input Relative to Ground0.5V to 4.1V
Voltage on Input Relative to V $_{\rm SS}$ 0.6V to (V $_{\rm CC}$ + 0.5V)
Voltage on DQ <sub>0-7</sub> or $\overline{\text{HSB}}$ 0.5V to (V <sub>CC</sub> + 0.5V)
Temperature under Bias55°C to 125°C
Storage Temperature65°C to 140°C
Power Dissipation 1W
DC Output Current (1 output at a time, 1s duration) 15 mA

#### NF (SOP-32) PACKAGE THERMAL CHARACTERISTICS

 $θ_{jc}$  5.4 C/W;  $θ_{ja}$  44.3 [0 fpm], 37.9 [200 fpm], 35.1 C/W [500 fpm]. RF (SSOP-48) PACKAGE THERMAL CHARACTERISTICS

 $\theta_{jc}\,6.2$  C/W;  $\theta_{ja}\,51.1$  [0 fpm], 44.7 [200 fpm], 41.8 C/W [500 fpm].

### **DC Characteristics**

 $(V_{CC} = 2.7V-3.6V)$ 

**Note:** Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

33	t <sub>SS</sub>	Soft Sequence Processing Time		70	μs	16, 17

#### Notes

15. Read and Write cycles in progress before HSB is asserted are given this minimum amount of time to complete.

- 16. This is the amount of time that it takes to take action on a soft sequence command. Vcc power must remain high to effectively register command.
- 17. Commands like Store and Recall lock out I/O until operation is complete which further increases this time. See specific command.

#### Notes

18. The six consecutive addresses must be in the order listed. W must be high during all six consecutive cycles to enable a nonvolatile cycle.

While there are 15 addresses on the STK14D88, only the lower 14 are used to control software modes
 I/O state depends on the state of G. The I/O table shown assumes G low.

# **STK14D88**

### nvSRAM Operation

#### nvSRAM

The STK14D88 nvSRAM is made up of two functional components paired in the same physical cell. These are the SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates like a standard fast static RAM. Data in the SRAM can be transferred to the nonvolatile cell (the STORE operation), or from the nonvolatile cell to SRAM (the RECALL operation). This unique architecture allows all cells to be stored and recalled in parallel. During the STORE and RECALL operations SRAM READ and WRITE operations are inhibited. The STK14D88 supports unlimited read and writes like a typical SRAM. In addition, it provides unlimited RECALL operafrom the nonvolatile cells and up to 200K STORE operations.

#### SRAM READ

The STK14D88 performs a READ cycle whenever E and G are low while W and HSB are high. The address specified on pins A<sub>0-16</sub> determine which of the 32,768 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t<sub>AVQV</sub> (READ cycle #1). If the READ is initiated by E and G, the outputs will be valid at t<sub>ELQV</sub> or at t<sub>GLQV</sub>, whichever is later (READ cycle #2). The data outputs repeatedly respond to address changes within the t<sub>AVQV</sub> access time without the need for transitions on any control input pins, and remain valid until another address change or until either E or G is brought high, or W or HSB is brought low.

#### SRAM WRITE

A WRITE cycle is performed whenever  $\overline{E}$  and  $\overline{W}$  are low and HSB is high. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either  $\overline{E}$  or  $\overline{W}$  goes high at the end of the cycle. The data on the common I/O pins DQ<sub>0-7</sub> will be written into memory if it is valid t<sub>D/WH</sub> before the end of a W controlled WRITE or t<sub>DVEH</sub> before the end of an  $\overline{E}$  controlled WRITE.

It is recommended that G be kept high during the entire WRITE cycle to avoid data bus contention on common I/O lines. If  $\overline{G}$  is left low, internal circuitry will turn off the output buffers  $t_{WLQZ}$  after w goes low.

#### AutoStore Operation

The STK14D88 stores data to nvSRAM using one of three storage operations. These three operations are Hardware Store (activated by HSB), Software Store (activated by an address sequence), and AutoStore (on power down).

AutoStore operation is a unique feature of Cypress Quantum Trap technology is enabled by default on the STK14D88.

During normal operation, the device will draw current from V<sub>CC</sub> to charge a capacitor connected to the V<sub>CAP</sub> pin. This stored charge will be used by the chip to perform a single STORE operation. If the voltage on the V<sub>CC</sub> pin drops below VSWITCH, the part will automatically disconnect the V<sub>CAP</sub> pin from V<sub>CC</sub>. A STORE operation will be initiated with power provided by the V<sub>CAP</sub> capacitor.

Figure 12 shows the proper connection of the storage capacitor ( $V_{CAP}$ ) for automatic store operation. Refer to the DC CHARAC-TERISTICS table for the size of the capacitor. The voltage on the

To reduce unneeded nonvolatile stores, AutoStore and Hardware Store operations will be ignored unless at least one WRITE operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a WRITE operation has taken place. The HSB signal can be monitored by the system to detect an AutoStore cycle is in progress.

#### Figure 12. AutoStore Mode

#### Hardware STORE (HSB) Operation

The STK14D88 provides the HSB pin for <u>controlling</u> and acknowledging the STORE operations. The HSB <u>pin</u> <u>can</u> be used to request a hardware STORE cycle. When the HSB pin is driven low, the STK14D88 will conditionally initiate a STORE operation after  $t_{DELAY}$ . An actual STORE cycle will only begin if a WRITE to the SRAM took place since the last STORE or RECALL cycle. The HSB pin has a very resistive pull up and is internally driven low to indicate a busy condition while the STORE (initiated by any means) is in progress. This pin should be externally pulled up if it is used to drive other inputs.

<u>SRAM READ and WRITE operations that are in progress when</u> HSB is driven low by any means are given <u>time</u> to complete before the STORE operation is initiated. After HSB goes low, the STK14D88 continues SRAM operations for t<sub>DELAY</sub>. During t<sub>DELAY</sub>, multiple SRAM REA<u>D</u> operations may take place. If a WRITE is in progress when HSB is pulled low, it will be allowed a time, t<sub>DELAY</sub>, to complete. However, any SRAM WRITE cycles requested after HSB goes low will be inhibited until HSB returns high.

If HSB is not used, it should be left unconnected.

#### Software STORE

Data can be transferred from the SRAM to the nonvolatile memory by a software address sequence. The STK14D88 software STORE cycle is initiated by executing sequential E controlled READ cycles from six specific address locations in exact order. During the STORE cycle, previous data is erased and then the new data is programmed into the nonvolatile elements. Once a STORE cycle is initiated, further memory inputs and outputs are disabled until the cycle is completed.

To initiate the software STORE cycle, the following READ sequence must be performed:

- 1. Read Address 0x0E38, Valid READ
- 2. Read Address 0x31C7, Valid READ
- 3. Read Address 0x03E0, Valid READ
- 4. Read Address 0x3C1F, Valid READ
- 5. Read Address 0x303F, Valid READ
- 6. Read Address 0x0FC0, Initiate STORE Cycle

After the sixth address in the sequence has been entered, the STORE cycle begins and the chip is disabled. It is important that READ cycles and not WRITE cycles be used in the sequence. After the t<sub>STORE</sub> cycle time has been fulfilled, the SRAM is again activated for READ and WRITE operation.

#### Software RECALL

Data can be transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of READ operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of  $\overline{E}$  controlled READ operations must be performed:

- 1. Read Address 0x0E38, Valid READ
- 2. Read Address 0x31C7, Valid READ
- 3. Read Address 0x03E0, Valid READ
- 4. Read Address 0x3C1F, Valid READ
- 5. Read Address 0x303F, Valid READ
- 6. Read Address 0x0C63, Initiate RECALL Cycle

Internally, RECALL is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. After the t<sub>RECALL</sub> cycle time, the SRAM will once again be ready for READ or WRITE operations. The RECALL operation in no way alters the data in the nonvolatile storage elements.

### **Data Protection**

The STK14D88 protects data from corruption during low-voltage conditions by inhibiting all externally initiated STORE and WRITE operations. The low-voltage condition is detected when  $V_{CC}$ <br/>V\_SWITCH-

If the STK14D88 is in a WRITE mode (both  $\overline{E}$  and  $\overline{W}$  low) at power up, after a RECALL, or after a STORE, the WRITE will be inhibited until a negative transition on  $\overline{E}$  or  $\overline{W}$  is detected. This protects against inadvertent writes during power up or brown out conditions.

### **Best Practices**

nvSRAM products have been used effectively for over 15 years. While ease-of-use is one of the product's main system values, experience gained working with hundreds of applications has resulted in the following suggestions as best practices:

- The nonvolatile cells in an nvSRAM are programmed on the test floor during final test and quality assurance. Incoming inspection routines at customer or contract manufacturer's sites sometimes reprogram these values. Final NV patterns are typically repeating patterns of AA, 55, 00, FF, A5, or 5A. End product's firmware should not assume an NV array is in a set programmed state. Routines that check memory content values to determine first time system configuration, cold or warm boot status, and so on, should always program a unique NV pattern (for example, a complex 4-byte pattern of 46 E6 49 53 hex or more random bytes) as part of the final system manufacturing test to ensure these system routines work consistently.
- Power up boot firmware routines should rewrite the nvSRAM into the desired state (such as AutoStore enabled). While the nvSRAM is shipped in a preset state, best practice is to rewrite the nvSRAM into the desired state as a safeguard against events that might flip the bit inadvertently (such as program bugs, incoming inspection routines, and others).
- If AutoStore has been firmware disabled, it will not reset to "autostore enabled" on every power down event captured by the nvSRAM. The application firmware should re-enable or re-disable AutoStore on each reset sequence based on the behavior desired.

■ The V<sub>CAP</sub> value specified in this data sheet includes a minimum and a maximum value size. Best practice is to meet this requirement and not exceed the max V<sub>CAP</sub> value because the nvSRAM internal algorithm calculates V<sub>CAP</sub> charge time based on this max V<sub>CAP</sub> value. Customers who want to use a larger V<sub>CAP</sub> value to make sure there is extra store charge and store time should discuss their V<sub>CAP</sub> size selection with Cypress to understand any impact on the V<sub>CAP</sub> voltage level at the end of a t<sub>RECALL</sub> period.

#### Low Average Active Power

CMOS technology provides the STK14D88 with the benefit of power supply current that scales with cycle time. Less current will be drawn as the memory cycle time becomes longer than 50 ns. Figure 13 shows the relationship between  $I_{CC}$  and READ/WRITE cycle time. Worst-case current consumption is shown for commercial temperature range,  $V_{CC} = 3.6V$ , and chip enable at maximum frequency. Only standby current is drawn when the chip is disabled. The overall average current drawn by the STK14D88 depends on the following items:

- The duty cycle of chip enable
- The overall cycle rate for operations
- The ratio of READs to WRITEs
- The operating temperature
- The V<sub>CC</sub> level
- I/O loading

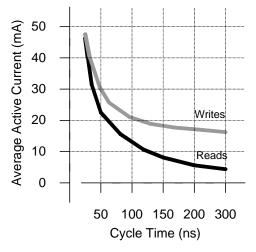

Figure 13. Current versus Cycle Time

#### **Noise Considerations**

The STK14D88 is a high speed memory and so must have a high frequency bypass capacitor of 0.1  $\mu F$  connected between both  $V_{CC}$  pins and  $V_{SS}$  ground plane with no plane break to chip  $V_{SS}$ . Use leads and traces that are as short as possible. As with all high speed CMOS ICs, careful routing of power, ground, and signals will reduce circuit noise.

NotRecomment

#### **Preventing AutoStore**

The AutoStore function can be disabled by initiating an *AutoStore Disable* sequence. A sequence of READ operations is performed in a manner similar to the software STORE initiation. To initiate the *AutoStore Disable* sequence, the following sequence of  $\vec{E}$  controlled or  $\vec{G}$  controlled READ operations must be performed:

- 1. Read Address 0x0E38, Valid READ
- 2. Read Address 0x31C7, Valid READ
- 3. Read Address 0x03E0, Valid READ
- 4. Read Address 0x3C1F, Valid READ
- 5. Read Address 0x303F, Valid READ
- 6. Read Address 0x03F8, AutoStore Disable

The AutoStore can be re-enabled by initiating an *AutoStore Enable* sequence. A sequence of READ operations is performed in a manner similar to the software RECALL initiation. To initiate the *AutoStore\_Enable* sequence, the following sequence of E controlled or G controlled READ operations must be performed:

- 1. Read Address 0x0E38, Valid READ
- 2. Read Address 0x31C7, Valid READ
- 3. Read Address 0x03E0, Valid READ
- 4. Read Address 0x3C1F, Valid READ
- 5. Read Address 0x303F, Valid READ
- 6. Read Address 0x07F0, AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (Hardware or Software) needs to be issued to save the AutoStore state through subsequent power down cycles. The part comes from the factory with AutoStore enabled.

In all cases, make sure the READ sequence is uninterrupted. For example, an interrupt that occurs in the sequence that reads the nvSRAM would abort this sequence, resulting in an error.
