

MM88C29 • MM88C30

Quad Single-Ended Line Driver • Dual Differential Line Driver

General Description

The MM88C30 is a dual differential line driver that also performs the dual four-input NAND or dual four-input AND function. The absence of a clamp diode to V_{CC} in the input protection circuitry of the MM88C30 allows a CMOS user to interface systems operating at different voltage levels. Thus, a CMOS digital signal source can operate at a V_{CC} voltage greater than the V_{CC} voltage of the MM88C30 line driver. The differential output of the MM88C30 eliminates ground-loop errors.

The MM88C29 is a non-inverting single-wire transmission line driver. Since the output ON resistance is a low 20Ω typ., the device can be used to drive lamps, relays, solenoids, and clock lines, besides driving data lines.

Features

- Wide supply voltage range: 3V to 15V
- High noise immunity: $0.45 V_{CC}$ (typ.)
- Low output ON resistance: 20Ω (typ.)

Typical Applications

Digital Data Transmission

Note A: Exact value depends on line length.
 Note B: Optional to control response time.
 Note C: $V_{CC} = 4.5V$ to $5.5V$ for the DS7820, $V_{CC} = 4.5V$ to $15V$ for the DS78C20.

V_{CC} is 3V to 15V.

Typical Data Rate vs Transmission Line Length

Note: The transmission line used was #22 gauge unshielded twisted pair (40k termination).

Note: The curves generated assume that both drivers are driving equal lines, and that the maximum power is 500 mW/package.
