

# Four Output Differential Buffer for PCI Express

ICS9DB401C

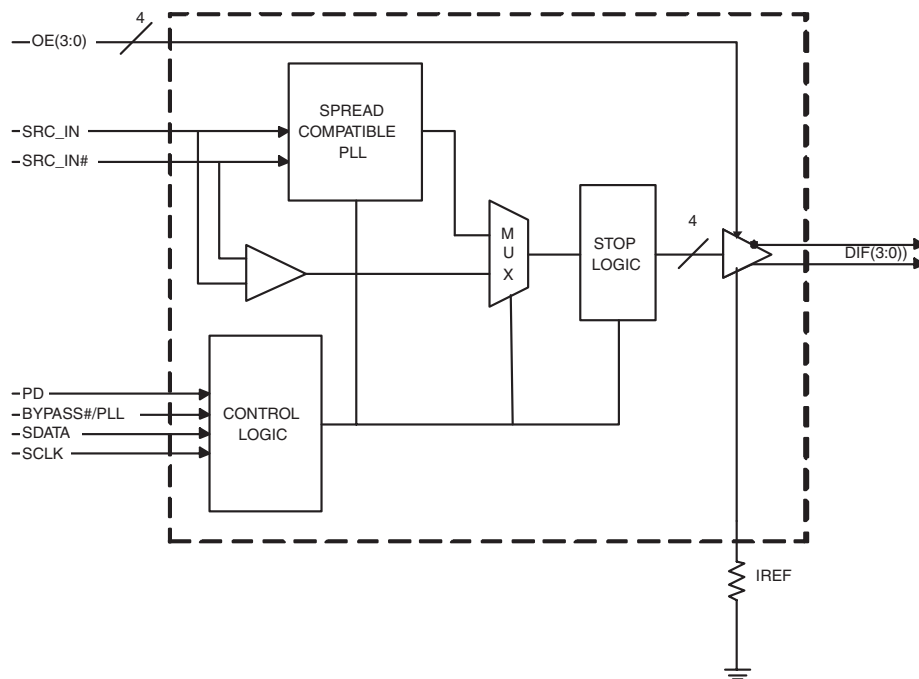

## Description

The 9DB401C is a DB400 Version 2.0 Yellow Cover part with PCI Express support. It can be used in PC or embedded systems to provide outputs that have low cycle-to-cycle jitter (50ps), low output-to-output skew (100ps), and are PCI Express gen 1 compliant. The 9DB401C supports a 1 to 4 output configuration, taking a spread or non spread differential HCSL input from a CK410(B) main clock such as 954101 and 932S401, or any other differential HCSL pair. 9DB401C can generate HCSL or LVDS outputs from 50 to 200MHz in PLL mode or 0 to 400Mhz in bypass mode. There are two de-jittering modes available selectable through the HIGH\_BW# input pin, high bandwidth mode provides de-jittering for spread inputs and low bandwidth mode provides extra de-jittering for non-spread inputs. The SRC\_STOP#, PD#, and OE real-time input pins provide completely programmable power management control.

## Output Features

- 4 - 0.7V HCSL or LVDS differential output pairs
- Supports zero delay buffer mode and fanout mode
- Bandwidth programming available

## Functional Block Diagram

Note: Polarities shown for OE\_INV = 0.

## 28-pin SSOP & TSSOP

### Polarity Inversion Pin List Table

Pins	OE_INV	
	0	1
8	OE_1	OE1#
15	PD#	PD
16	DIF_STOP#	DIF_STOP
21	OE_6	OE6#

### Power Groups

Pin Number		Description
VDD	GND	
1	4	SRC_IN/SRC_IN#
5,11,18, 24	4	DIF(1,2,5,6)
N/A	27	IREF
28	27	Analog VDD & GND for PLL core

**Pin Description for OE\_INV = 0**

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	VDD	PWR	Power supply, nominal 3.3V
2	SRC_IN	IN	0.7 V Differential SRC TRUE input
3	SRC_IN#	IN	0.7 V Differential SRC COMPLEMENTARY input
4	GND	PWR	Ground pin.
5	VDD	PWR	Power supply, nominal 3.3V
6	DIF_1	OUT	0.7V differential true clock output
7	DIF_1#	OUT	0.7V differential complement clock output
8	OE_1	IN	Active high input for enabling output 1. 0 = tri-state outputs, 1= enable outputs
9	DIF_2	OUT	0.7V differential true clock output
10	DIF_2#	OUT	0.7V differential complement clock output
11	VDD	PWR	Power supply, nominal 3.3V
12	BYPASS#/PLL	IN	Input to select Bypass(fan-out) or PLL (ZDB) mode 0 = Bypass mode, 1= PLL mode
13	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
14	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
15	PD#	IN	Asynchronous active low input pin used to power down the device. The internal clocks are disabled and the VCO and the crystal are stopped.
16	SRC_STOP#	IN	Active low input to stop SRC outputs.
17	HIGH_BW#	IN	3.3V input for selecting PLL Band Width 0 = High, 1= Low
18	VDD	PWR	Power supply, nominal 3.3V
19	DIF_5#	OUT	0.7V differential complement clock output
20	DIF_5	OUT	0.7V differential true clock output
21	OE_6	IN	Active high input for enabling output 6. 0 = tri-state outputs, 1= enable outputs
22	DIF_6#	OUT	0.7V differential complement clock output
23	DIF_6	OUT	0.7V differential true clock output
24	VDD	PWR	Power supply, nominal 3.3V
25	OE_INV	IN	This latched input selects the polarity of the OE pins. 0 = OE pins active high, 1 = OE pins active low (OE#)
26	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
27	GNDA	PWR	Ground pin for the PLL core.
28	VDDA	PWR	3.3V power for the PLL core.

**Pin Description for OE\_INV = 1**

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	VDD	PWR	Power supply, nominal 3.3V
2	SRC_IN	IN	0.7 V Differential SRC TRUE input
3	SRC_IN#	IN	0.7 V Differential SRC COMPLEMENTARY input
4	GND	PWR	Ground pin.
5	VDD	PWR	Power supply, nominal 3.3V
6	DIF_1	OUT	0.7V differential true clock output
7	DIF_1#	OUT	0.7V differential complement clock output
8	OE1#	IN	Active low input for enabling DIF pair 1. 1 = tri-state outputs, 0 = enable outputs
9	DIF_2	OUT	0.7V differential true clock output
10	DIF_2#	OUT	0.7V differential complement clock output
11	VDD	PWR	Power supply, nominal 3.3V
12	BYPASS#/PLL	IN	Input to select Bypass(fan-out) or PLL (ZDB) mode 0 = Bypass mode, 1= PLL mode
13	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
14	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
15	PD	IN	Asynchronous active high input pin used to power down the device. The internal clocks are disabled and the VCO is stopped.
16	SRC_STOP	IN	Active high input to stop SRC outputs.
17	HIGH_BW#	IN	3.3V input for selecting PLL Band Width 0 = High, 1= Low
18	VDD	PWR	Power supply, nominal 3.3V
19	DIF_5#	OUT	0.7V differential complement clock output
20	DIF_5	OUT	0.7V differential true clock output
21	OE6#	IN	Active low input for enabling DIF pair 6. 1 = tri-state outputs, 0 = enable outputs
22	DIF_6#	OUT	0.7V differential complement clock output
23	DIF_6	OUT	0.7V differential true clock output
24	VDD	PWR	Power supply, nominal 3.3V
25	OE_INV	IN	This latched input selects the polarity of the OE pins. 0 = OE pins active high, 1 = OE pins active low (OE#)
26	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
27	GNDA	PWR	Ground pin for the PLL core.
28	VDDA	PWR	3.3V power for the PLL core.

## Absolute Max

Symbol	Parameter	Min	Max	Units
VDD_A	3.3V Core Supply Voltage		4.6	V
VDD_In	3.3V Logic Supply Voltage		4.6	V

## General SMBus serial interface information for the ICS9DB401C

### How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address  $DC_{(h)}$
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) sends the data byte count = X
- ICS clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N + X - 1**
- ICS clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

### How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address  $DC_{(h)}$
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address  $DD_{(h)}$
- ICS clock will **acknowledge**
- ICS clock will send the data byte count = X
- ICS clock sends **Byte N + X - 1**
- ICS clock sends **Byte 0 through byte X (if  $X_{(h)}$  was written to byte 8).**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

## PD#

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

## PD# Assertion

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with  $2 \times I_{REF}$  and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.

## PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC\_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must driven to a voltage of >200 mV within 300 ms of PD# de-assertion.

Note: Polarities in timing diagrams are shown OE\_INV = 0. They are similar to OE\_INV = 1.

### SRC\_STOP#

The SRC\_STOP# signal is an active-low asynchronous input that cleanly stops and starts the DIF outputs. A valid clock must be present on SRC\_IN for this input to work properly. The SRC\_STOP# signal is de-bounced and must remain stable for two consecutive rising edges of DIF# to be recognized as a valid assertion or de-assertion.

#### SRC\_STOP# - Assertion (transition from '1' to '0')

Asserting SRC\_STOP# causes all DIF outputs to stop after their next transition (if the control register settings allow the output to stop). When the SRC\_STOP# drive bit is '0', the final state of all stopped DIF outputs is DIF = High and DIF# = Low. There is no change in output drive current. DIF is driven with 6xI<sub>REF</sub>. DIF# is not driven, but pulled low by the termination. When the SRC\_STOP# drive bit is '1', the final state of all DIF output pins is Low. Both DIF and DIF# are not driven.

All stopped differential outputs resume normal operation in a glitch-free manner. The de-assertion latency to active outputs is 2-6 DIF clock periods, with all DIF outputs resuming simultaneously. If the SRC\_STOP# drive control bit is '1' (tri-state), all stopped DIF outputs must be driven High (>200 mV) within 10 ns of de-assertion.

#### SRC\_STOP\_1 (SRC\_Stop = Driven, PD = Driven)

#### SRC\_STOP\_2 (SRC\_Stop = Tristate, PD = Driven)

**SRC\_STOP\_3 (SRC\_Stop = Driven, PD = Tristate)**

**SRC\_STOP\_4 (SRC\_Stop = Tristate, PD = Tristate)**

**ICS9DB401C**  
**Four Output Differential Buffer for PCI Express**

**209 mil SSOP**
