- 4*0.7V current -mode differential SRC CLK pair
- 7*PCI, 3 free running, 33.3MHz
- 1*48MHz
- 2*REF

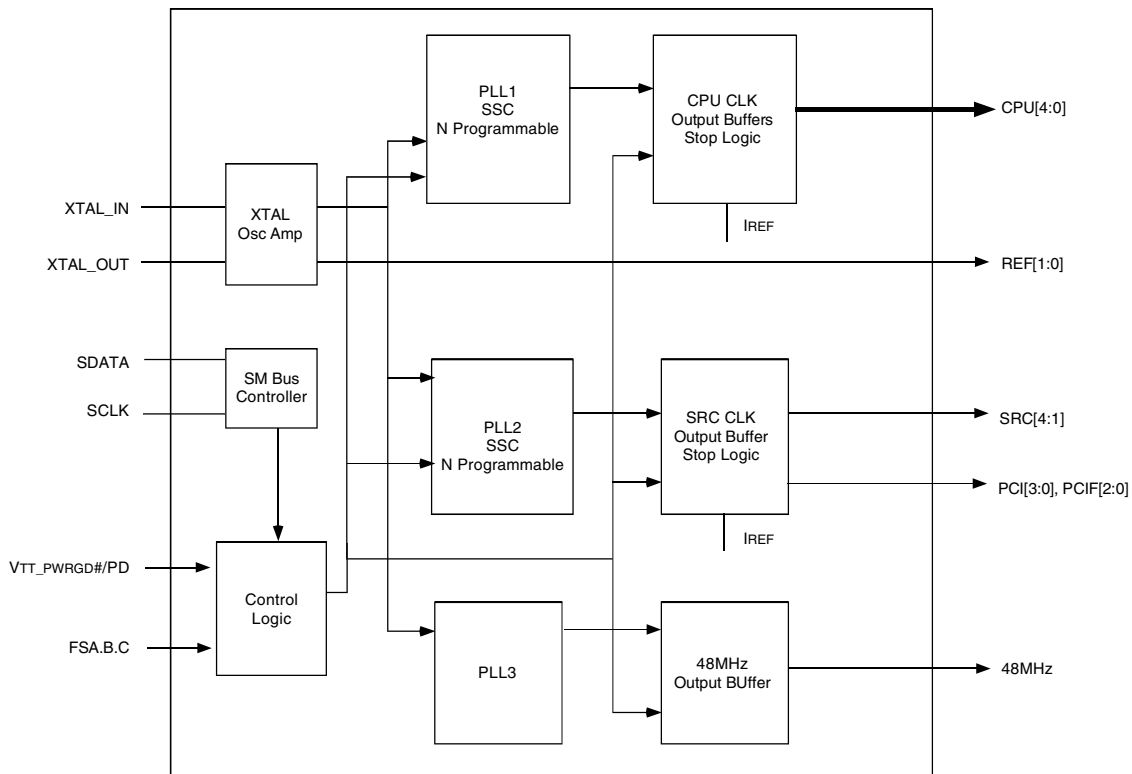

DESCRIPTION:

IDTCV152 is a 56 pin clock device, compliant with Intel CK410B specification. The CPU output buffer is designed to support up to 400MHz processor. This chip has three PLLs inside for CPU, SRC/PCI, and 48MHz IO clocks. This device also implements Band-gap referenced IREF to reduce the impact of V_{DD} variation on differential outputs, which can provide more robust system performance. Each CPU and SRC/PCI has its own Spread Spectrum selection, which allows for isolated changes instead of affecting other clock groups.

KEY SPECIFICATION:

- CPU CLK cycle to cycle jitter < 85ps
- SRC CLK cycle to cycle jitter < 100ps
- PCI CLK cycle to cycle jitter < 250ps

PCI STOP FUNCTIONALITY

If PCIF (2:0) and SRC clocks are set to be free-running through SMBus programming, they will ignore the PCI_STOP register bit.

PCI_STOP (Byte 6 bit 3)	CPU	CPU#	SRC	SRC#	PCIF/PCI	USB	DOT96	DOT96#	REF
1	Normal	Normal	Normal	Normal	33MHz	48MHz	Normal	Normal	14.318MHz
0	Normal	Normal	IREF * 6 or float	Low	Low	48MHz	Normal	Normal	14.318MHz

PD, POWER DOWN

PD is an asynchronous active high input used to shut off all clocks cleanly prior to clock power. When PD is asserted high all clocks will be driven low before turning off the VCO. In PD de-assertion all clocks will start without glitches.

PD	CPU	CPU#	SRC	SRC#	PCIF/PCI	USB	REF
0	Normal	Normal	Normal	Normal	33MHz	48MHz	14.318MHz
1	IREF * 2 or float	Float	IREF * 2 or float	Float	Low	Low	Low

PD ASSERTION

PD DE-ASSERTION

The time from the de-assertion of PD or until power supply ramps to get stable clocks will be less than 1.8ms. If the drive mode control bit for PD tristate is programmed to '1' the stopped differential pair must first be driven high to a minimum of 200mV in less than 300µs of PD deassertion.
