

## μP-PROGRAMMABLE PRECISION CLOCK MULTIPLIER

### Description

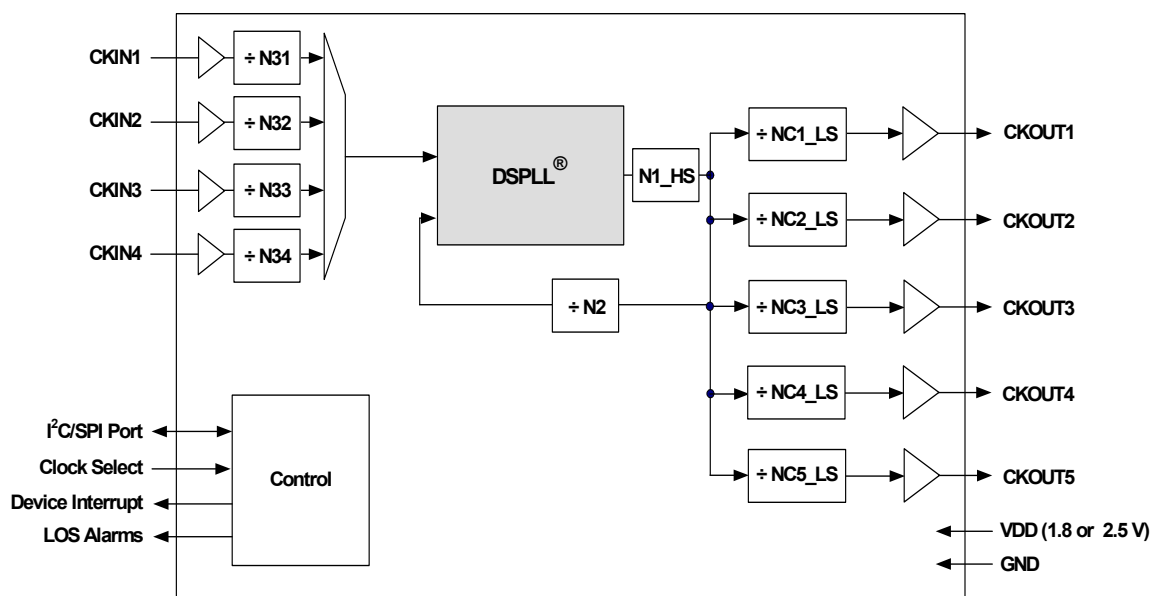

The Si5367 is a low jitter, precision clock multiplier for applications requiring clock multiplication without jitter attenuation. The Si5367 accepts four clock inputs ranging from 10 to 707 MHz and generates five frequency-multiplied clock outputs ranging from 10 to 945 MHz and select frequencies to 1.4 GHz. The device provides virtually any frequency translation combination across this operating range. The outputs are divided down separately from a common source. The Si5367 input clock frequency and clock multiplication ratio are programmable through an I<sup>2</sup>C or SPI interface. The Si5367 is based on Silicon Laboratories' 3rd-generation DSPLL<sup>®</sup> technology, which provides any-rate frequency synthesis in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The DSPLL loop bandwidth is digitally programmable, providing jitter performance optimization at the application level. Operating from a single 1.8 or 2.5 V supply, the Si5367 is ideal for providing clock multiplication in high performance timing applications.

### Applications

- SONET/SDH OC-48/OC-192 STM-16/STM-64 line cards
- GbE/10GbE, 1/2/4/8/10GFC line cards
- ITU G.709 and custom FEC line cards
- Wireless basestations
- Data converter clocking
- xDSL
- SONET/SDH + PDH clock synthesis
- Test and measurement

### Features

- Generates any frequency from 10 to 945 MHz and select frequencies to 1.4 GHz from an input frequency of 10 to 710 MHz
- Low jitter clock outputs w/jitter generation as low as 0.6 ps rms (50 kHz–80 MHz)
- Integrated loop filter with selectable loop bandwidth (30 kHz to 1.3 MHz)
- Four clock inputs with manual or automatically controlled switching
- Five clock outputs with selectable signal format (LVPECL, LVDS, CML, CMOS)
- Support for ITU G.709 FEC ratios (255/238, 255/237, 255/236)
- LOS alarm outputs
- Digitally-controlled output phase adjust
- I<sup>2</sup>C or SPI programmable settings
- On-chip voltage regulator for 1.8 ±5% or 2.5 V ±10% operation
- Small size: 14 x 14 mm 100-pin TQFP
- Pb-free, RoHS compliant

**Table 1. Performance Specifications** $(V_{DD} = 1.8 \pm 5\%$  or  $2.5 V \pm 10\%$ ,  $T_A = -40$  to  $85\text{ }^\circ\text{C}$ )

## 1. Functional Description

The Si5367 is a low jitter, precision clock multiplier for applications requiring clock multiplication without jitter attenuation. The Si5367 accepts four clock inputs ranging from 10 to 707 MHz and generates five frequency-multiplied clock outputs ranging from 10 to 945 MHz and select frequencies to 1.4 GHz. The device provides virtually any frequency translation combination across this operating range. Independent dividers are available for every input clock and output clock, so the Si5367 can accept input clocks at different frequencies and it can generate output clocks at different frequencies. The Si5367 input clock frequency and clock multiplication ratio are programmable through an I<sup>2</sup>C or SPI interface. Silicon Laboratories offers a PC-based software utility, *DSPLLsim*, that can be used to determine the optimum PLL divider settings for a given input frequency/clock multiplication ratio combination that minimizes phase noise and power consumption. This utility can be downloaded from <http://www.silabs.com/timing> (click on Documentation).

The Si5367 is based on Silicon Laboratories' 3rd-generation DSPLL<sup>®</sup> technology, which provides any-rate frequency synthesis in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The Si5367 PLL loop bandwidth is digitally programmable and supports a range from 30 kHz to 1.3 MHz. The *DSPLLsim* software utility can be used to calculate valid loop bandwidth settings for a given input clock frequency/clock multiplication ratio.

The Si5367 monitors all input clocks for loss-of-signal and provides a LOS alarm when it detects missing pulses on its inputs.

In the case when the input clocks enter alarm conditions, the PLL will freeze the DCO output frequency near its last value to maintain operation with an internal state close to the last valid operating state.

The Si5367 has five differential clock outputs. The signal format of the clock outputs is programmable to support LVPECL, LVDS, CML, or CMOS loads. If not required, unused clock outputs can be powered down to minimize power consumption. In addition, the phase of each output clock may be adjusted in relation to the other output clocks. The resolution varies from 800 ps to 2.2 ns depending on the PLL divider settings. Consult the *DSPLLsim* configuration software to determine the phase offset resolution for a given input clock/clock multiplication ratio combination. For system-level debugging, a bypass mode is available which drives the output clock directly from the input clock, bypassing the internal DSPLL. The device is powered by a single 1.8 or 2.5 V supply.

## 1.1. Further Documentation

Consult the Silicon Laboratories Any-Rate Precision Clock Family Reference Manual (FRM) for detailed information about the Si5367. Additional design support is available from Silicon Laboratories through your distributor.

Silicon Laboratories has developed a PC-based software utility called *DSPLLsim* to simplify device configuration, including frequency planning and loop bandwidth selection. The FRM and this utility can be downloaded from <http://www.silabs.com/timing>; click on Documentation.

## 2. Pin Descriptions: Si5367

**Table 3. Si5367 Pin Descriptions**

Pin #	Pin Name	I/O	Signal Level	Description
1, 2, 4, 17, 20, 22, 23, 24, 25, 37, 47, 48, 49, 50, 51, 52, 53, 56, 66, 67, 72, 73, 74, 75, 80, 85, 95	NC			<b>No Connect.</b> These pins must be left unconnected for normal operation.
3	RST	I	LVC MOS	<b>External Reset.</b> Active low input that performs external hardware reset of device. Resets all internal logic to a known state and forces the device registers to their default value. Clock outputs are disabled during reset. The part must be programmed after a reset or power-on to get a clock output. See Family Reference Manual for details. This pin has a weak pull-up.

**Note:** Internal register names are indicated by underlined italics, e.g. *INT\_PIN*. See Si5368 Register Map.

34 35	CKIN2+ CKIN2-	I	MULTI	<p><b>Clock Input 2.</b>            Differential input clock. This input can also be driven with a single-ended signal.</p>										

**Note:** Internal register names are indicated by underlined italics, e.g. INT\_PIN. See Si5368 Register Map.

Table 3. Si5367 Pin Descriptions (Continued)

Pin #	Pin Name	I/O	Signal Level	Description
39 40	CKIN3+ CKIN3–	I	MULTI	<b>Clock Input 3.</b> Differential clock input. This input can also be driven with a single-ended signal. CKIN3 serves as the frame sync input associated with the CKIN1 clock when <u>CK_CONFIG_REG</u> = 1.
44 45	CKIN1+ CKIN1–	I	MULTI	<b>Clock Input 1.</b> Differential clock input. This input can also be driven with a single-ended signal.
58	C1A	O	LVC MOS	<b>CKIN1 Active Clock Indicator.</b> This pin serves as the CKIN1 active clock indicator. The <u>CK1_ACTV_REG</u> bit always reflects the active clock status for CKIN1. If <u>CK1_ACTV_PIN</u> = 1, this status will also be reflected on the C1A pin with active polarity controlled by the <u>CK_ACTV_POL</u> bit. If <u>CK1_ACTV_PIN</u> = 0, this output tristates.
59	C2A	O	LVC MOS	<b>CKIN2 Active Clock Indicator.</b> This pin serves as the CKIN2 active clock indicator. The <u>CK2_ACTV_REG</u> bit always reflects the active clock status for CKIN_2. If <u>CK2_ACTV_PIN</u> = 1, this status will also be reflected on the C2A pin with active polarity controlled by the <u>CK_ACTV_POL</u> bit. If <u>CK2_ACTV_PIN</u> = 0, this output tristates.
60	SCL	I	LVC MOS	<b>Serial Clock.</b> This pin functions as the serial port clock input for both SPI and I <sup>2</sup> C modes. This pin has a weak pull-down.
61	SDA_SDO	I/O	LVC MOS	<b>Serial Data.</b> In I <sup>2</sup> C microprocessor control mode (CMODE = 0), this pin functions as the bidirectional serial data port. In SPI microprocessor control mode (CMODE = 1), this pin functions as the serial data output.
68 69	A0 A1	I	LVC MOS	<b>Serial Port Address.</b> In I <sup>2</sup> C control mode (CMODE = 0), these pins function as hardware controlled address bits. The I <sup>2</sup> C address is 1101 [A2][A1][A0.] In SPI control mode (CMODE = 1), these pins are ignored. This pin has a weak pull-down.
70	A2_SS	I	LVC MOS	<b>Serial Port Address/Slave Select.</b> In I <sup>2</sup> C microprocessor control mode (CMODE = 0), this pin functions as a hardware controlled address bit. The I <sup>2</sup> C address is 1101 [A2][A1][A0.] In SPI microprocessor control mode (CMODE = 1), this pin functions as the slave select input. This pin has a weak pull-down.
<b>Note:</b> Internal register names are indicated by underlined italics, e.g. <u>INT_PIN</u> . See Si5368 Register Map.				

Table 3. Si5367 Pin Descriptions (Continued)

Pin #	Pin Name	I/O	Signal Level	Description
71	SDI	I	LVC MOS	<b>Serial Data In.</b> In SPI microprocessor control mode (CMODE = 1), this pin functions as the serial data input. In I <sup>2</sup> C microprocessor control mode (CMODE = 0), this pin is ignored. This pin has a weak pull-down.
77 78	CKOUT3+ CKOUT3–	O	MULTI	<b>Clock Output 3.</b> Differential clock output. Output signal format is selected by <u>SFOUT3_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
82 83	CKOUT1– CKOUT1+	O	MULTI	<b>Clock Output 1.</b> Differential clock output. Output signal format is selected by <u>SFOUT1_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
87 88	CKOUT5– CKOUT5+	O	MULTI	<b>Clock Output 5.</b> Differential clock output. Output signal format is selected by <u>SFOUT5_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
90	CMODE	I	LVC MOS	<b>Control Mode.</b> Selects I <sup>2</sup> C or SPI control mode for the device. 0 = I <sup>2</sup> C Control Mode. 1 = SPI Control Mode. This pin must be tied high or low.
92 93	CKOUT2+ CKOUT2–	O	MULTI	<b>Clock Output 2.</b> Differential clock output. Output signal format is selected by <u>SFOUT2_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
97 98	CKOUT4– CKOUT4+	O	MULTI	<b>Clock Output 4.</b> Differential clock output. Output signal format is selected by <u>SFOUT4_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
GND PAD	GND PAD	GND	Supply	<b>Ground Pad.</b> The ground pad must provide a low thermal and electrical impedance to a ground plane.

**Note:** Internal register names are indicated by underlined italics, e.g. INT\_PIN. See Si5368 Register Map.

## 3. Ordering Guide

Ordering Part Number	Output Clock Frequency Range	Package	ROHS6, Pb-Free	Temperature Range
Si5367A-C-GQ	10–945 MHz 970–1134 MHz 1.213–1.417 GHz	100-Pin 14 x 14 mm TQFP	Yes	–40 to 85 °C
Si5367B-C-GQ	10–808 MHz	100-Pin 14 x 14 mm TQFP	Yes	–40 to 85 °C
Si5367C-C-GQ	10–346 MHz	100-Pin 14 x 14 mm TQFP	Yes	–40 to 85 °C

## 4. Package Outline: 100-Pin TQFP

Figure 4 illustrates the package details for the Si5366. Table 4 lists the values for the dimensions shown in the illustration.

Figure 4. 100-Pin Thin Quad Flat Package (TQFP)

Table 4. 100-Pin Package Diagram Dimensions

Dimension	Min	Nom	Max	Dimension	Min	Nom	Max
A	—	—	1.20	E	16.00 BSC

R2	—	1.00

**Notes (General):**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
3. This Land Pattern Design is based on IPC-7351 guidelines.
4. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.

**Notes (Solder Mask Design):**

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60  $\mu\text{m}$  minimum, all the way around the pad.

**Notes (Stencil Design):**

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for the perimeter pads.
4. A 4 x 4 array of 0.80 mm square openings on 1.05 mm pitch should be used for the center ground pad.

**Notes (Card Assembly):**

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.

## DOCUMENT CHANGE LIST

### Revision 0.1 to Revision 0.2

- Changed LVTTTL to LVCMOS in Table 2, "Absolute Maximum Ratings," on page 3.
- Updated "2. Pin Descriptions: Si5367".
  - Changed FSOUT (pins 87 and 88) to CLKOUT5.
  - Changed FS\_ALIGN (pin 21) control pin to GND.
  - Changed pin 16 to ground.

### Revision 0.2 to Revision 0.3

- Removed references to latency control, INC, and DEC pins.
- Updated block diagram on page 1.
- Added Figure 1, "Typical Phase Noise Plot," on page 4.
- Updated "2. Pin Descriptions: Si5367".
  - Changed font of register names to *underlined italics*.
- Updated "3. Ordering Guide" on page 12.
- Added "5. Recommended PCB Layout".

### Revision 0.3 to Revision 0.5

- Changed 1.8 V operating range to  $\pm 5\%$ .
- Clarified "2. Pin Descriptions: Si5367" on page 7.
- Updated "4. Package Outline: 100-Pin TQFP" on page 13.

**NOTES:**

## CONTACT INFORMATION
