Si5365

PIN-PROGRAMMABLE PRECISION CLOCK MULTIPLIER

Description

The Si5365 is a low jitter, precision clock multiplier for high-speed communication systems, including SONET OC-48/OC-192, Ethernet, and Fibre Channel, in which the application requires clock multiplication without jitter attenuation. The Si5365 accepts four clock inputs ranging from 19.44 to 707 MHz and generates five frequency-multiplied clock outputs ranging from 19.44 to 1050 MHz. The input clock frequency and clock multiplication ratio are selectable from a table of popular SONET, Ethernet, and Fibre Channel rates. The Si5365 is based on Silicon Laboratories' 3rd-generation DSPLL® technology, which provides any-rate frequency synthesis in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The DSPLL loop bandwidth is digitally programmable, providing jitter performance optimization at the application level. Operating from a single 1.8 or 2.5 V supply, the Si5365 is ideal for providing clock multiplication in high performance timing applications.

Applications

- SONET/SDH OC-48/STM-16 and STM-64/OC-192 line cards
- GbE/10GbE, 1/2/4/8/10GFC line cards
- ITU G.709 line cards
- Test and measurement

Features

- Selectable output frequencies ranging from 19.44 to 1050 MHz
- Low jitter clock outputs w/jitter generation as low as 0.6 ps rms (50 kHz–80 MHz)
- Integrated loop filter with selectable loop bandwidth (30 kHz to 1.3 MHz)
- Four clock inputs w/manual or automatically controlled switching
- Five clock outputs with selectable signal format (LVPECL, LVDS, CML, CMOS)
- Support for ITU G.709 FEC ratios (255/238, 255/237, 255/236)
- LOS alarm outputs
- Digitally-controlled output phase adjust
- Pin-programmable settings
- On-chip voltage regulator for 1.8 ±5% or 2.5 V ±10% operation
- Small size: 14 x 14 mm 100-pin TQFP
- Pb-free, RoHS compliant

Si5365

1. Functional Description

The Si5365 is a low jitter, precision clock multiplier for high-speed communication systems, including SONET OC-48/OC-192, SDH STM-16/STM-64, Ethernet, and Fibre Channel, in which the application requires clock multiplication without jitter attenuation. The Si5365 accepts four clock inputs ranging from 19.44 to 707 MHz and generates five frequency-multiplied clock outputs ranging from 19.44 to 1050 MHz. By default the four clock inputs are at the same frequency and the five clock outputs are at the same frequency. Two of the output clocks can be divided down further to generate an integer sub-multiple frequency. The input clock frequency and clock multiplication ratio are selectable from a table of popular SONET, Ethernet, and Fibre Channel rates. In addition to providing clock multiplication in SONET and datacom applications, the Si5365 supports SONET-to-datacom frequency translations. Silicon Laboratories offers a PC-based software utility, DSPLL*sim*, that can be used to look up valid Si5365 frequency translations. This utility can be downloaded from http://www.silabs.com/timing (click on Documentation).

The Si5365 is based on Silicon Laboratories' 3rd-generation DSPLL$^{®}$ technology, which provides any-rate frequency synthesis in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The Si5365 PLL loop bandwidth is digitally programmable via the BWSEL[1:0] pins and supports a range from 30 kHz to 1.3 MHz. The DSPLL*sim* software utility can be used to calculate valid loop bandwidth settings for a given input clock frequency/clock multiplication ratio.

The Si5365 monitors all input clocks for loss-of-signal and provides a LOS alarm when it detects a missing clock.

In the case when the input clocks enter alarm conditions, the PLL will freeze the DCO output frequency near its last value to maintain operation with an internal state close to the last valid operating state.

The Si5365 has five differential clock outputs. The signal format of the clock outputs is programmable to support LVPECL, LVDS, CML, or CMOS loads. If not required, unused clock outputs can be powered down to minimize power consumption. For system-level debugging, a bypass mode is available which drives the output clock directly from the input clock, bypassing the internal DSPLL. The device is powered by a single 1.8 or 2.5 V supply.

1.1. Further Documentation

Consult the Silicon Laboratories Any-Rate Precision Clock Family Reference Manual (FRM) for detailed information about the Si5365. Additional design support is available from Silicon Laboratories through your distributor.

Silicon Laboratories has developed a PC-based software utility called DSPLL*sim* to simplify device configuration, including frequency planning and loop bandwidth selection. The FRM and this utility can be downloaded from http://www.silabs.com/timing; click on Documentation.

3	$\overline{RST}$	I	LVCMOS	**External Reset.** Active low input that performs external hardware reset of device. Resets all internal logic to a known state and forces the device registers to their default value. Clock outputs are tristated during reset. After rising edge of $\overline{RST}$ signal, the device will perform an internal self-calibration. This pin has a weak pullup.
4	FRQTBL	I	3-Level	**Frequency Table Select.** This pin selects SONET/SDH, datacom, or SONET/SDH to datacom frequency translation table. L = SONET/SDH. M = Datacom. H = SONET/SDH to Datacom. This pin has a weak pullup and weak pulldown and defaults to M. Some designs may require an external resistor voltage divider when driven by an active device that will tri-state.

01	CKIN2
10	CKIN3
11	CKIN4	 These inputs are internally deglitched to prevent inadvertent clock switching during changes in the CSn input state. If configured as input, these pins must not float. **Output**: If automatic clock detection is chosen (AUTOSEL = M or H), these pins function as the CKINn active clock indicator output. 0 = CKINn is not the active input clock. 1 = CKINn is currently the active input clock to the PLL. This pin has a weak pulldown.
22	AUTOSEL	I	3-Level	**Manual/Automatic Clock Selection.** Three level input that selects the method of input clock selection to be used. L = Manual. M = Automatic non-revertive. H = Automatic revertive. This pin has a weak pullup and weak pulldown and defaults to M. Some designs may require an external resistor voltage divider when driven by an active device that will tri-state.
29 30	CKIN4+ CKIN4–	I	MULTI	**Clock Input 4.** Differential clock input. This input can also be driven with a single-ended signal.

H = BYPASS Mode with CKOUT2 enabled. This pin has a weak pullup and weak pulldown and defaults to M. Some designs may require an external resistor voltage divider when driven by an active device that will tri-state.
39 40	CKIN3+ CKIN3–	I	MULTI	**Clock Input 3.** Differential clock input. This input can also be driven with a single-ended signal.
44 45	CKIN1+ CKIN1–	I	MULTI	**Clock Input 1.** Differential clock input. This input can also be driven with a single-ended signal.
50	DBL5	I	3-Level	**CKOUT5 Disable.** This pin performs the following functions: L = Normal operation. Output path is active and signal format is determined by SFOUT inputs. M = CMOS signal format. Overrides SFOUT signal format to allow CKOUT5 to operate in CMOS format while the clock outputs operate in a differential output format. H = Powerdown. Entire CKOUT5 divider and output buffer path is powered down. CKOUT5 output will be in tristate mode during powerdown. This pin has a weak pullup and weak pulldown and defaults to M. Some designs may require an external resistor voltage divider when driven by an active device that will tri-state.
56	FOS_CTL	I	3-Level	**Frequency Offset Control.** This pin enables or disables use of the CKIN2 FOS reference as an input to the clock selection state machine. L = FOS Disabled. M = Stratum 3/3E FOS Threshold. H = SONET Minimum Clock FOS Threshold. This pin has both weak pullups and weak pulldowns and defaults to M. Some designs may require an external resistor voltage divider when driven by an active device that will tri-state.
58	C1A	O	LVCMOS	**CKIN1 Active Clock Indicator.** This pin serves as the CKIN1 active clock indicator. 0 = CKIN1 is not the active input clock. 1 = CKIN1 is currently the active input clock to the PLL.
59	C2A	O	LVCMOS	**CKIN2 Active Clock Indicator.** This pin serves as the CKIN2 active clock indicator. 0 = CKIN2 is not the active input clock. 1 = CKIN2 is currently the active input clock to the PLL.

Notes (Solder Mask Design):
1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Notes (Stencil Design):
1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for the perimeter pads.
4. A 4 x 4 array of 0.80 mm square openings on 1.05 mm pitch should be used for the center ground pad.

Notes (Card Assembly):
1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.
