

## GENERAL DESCRIPTION

The ICS83026I-01 is a low skew, 1-to-2 Differential-to-LVCMOS/LVTTL Fanout Buffer. The differential input can accept most differential signal types (LVPECL, LVDS, LVHSTL, HCSL and SSTL) and translate to two single-ended LVCMOS/LVTTL outputs. The small 8-lead SOIC footprint makes this device ideal for use in applications with limited board space.

## FEATURES

- Two LVCMOS / LVTTL outputs
- Differential CLK, nCLK input pair
- CLK, nCLK pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, HCSL, SSTL
- Maximum output frequency: 350MHz
- Output skew: 15ps (maximum)
- Part-to-part skew: 600ps (maximum)
- Additive phase jitter, RMS: 0.03ps (typical)
- Small 8 lead SOIC package saves board space
- 3.3V core, 3.3V, 2.5V or 1.8V output operating supply
- -40°C to 85°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free RoHS (6) packages

#### ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in

the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements have issues. The primary issue relates to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The de-

vice meets the noise floor of what is shown, but can actually be lower. The phase noise is dependant on the input source and measurement equipment.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{DD}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{DD} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

### RECOMMENDATIONS FOR UNUSED OUTPUT PINS

#### OUTPUTS:

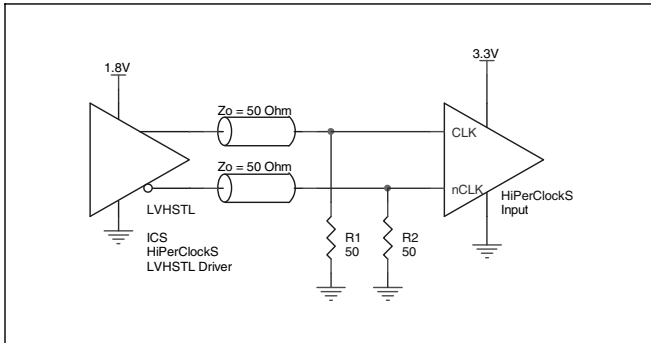

##### LVCMOS OUTPUTS

All unused LVCMOS output can be left floating. We recommend that there is no trace attached.

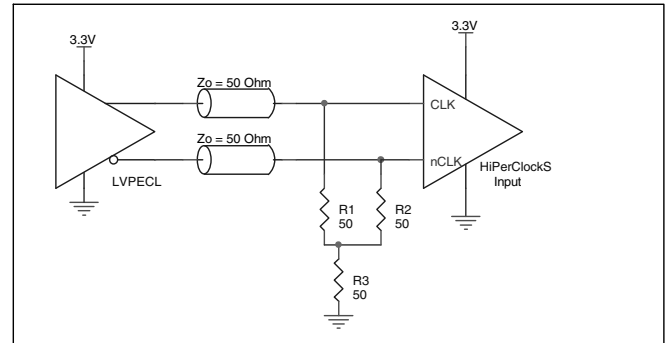

#### DIFFERENTIAL CLOCK INPUT INTERFACE

The CLK /nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSTL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 2A to 2E show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are

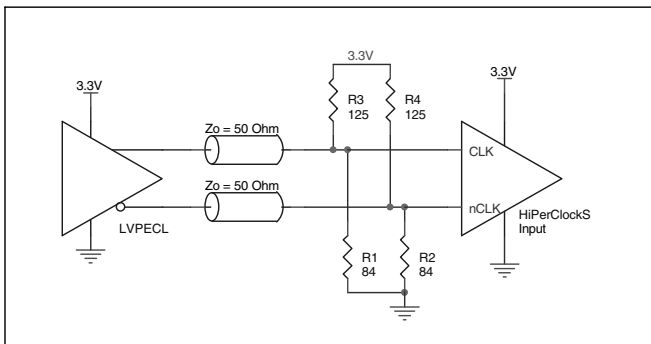

examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 2A*, the input termination applies for LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

#### SCHEMATIC EXAMPLE

Figure 3 shows an application schematic example of ICS83026I-01. The ICS83026I-01 CLK/nCLK input can directly accept various types of differential signal. In this example, the input is driven by an LVDS driver. The ICS83026I-01 outputs are

LVCMOS drivers. In this example, series termination approach is shown. Additional termination approaches are shown in the LVCMOS Termination Application Note.
