

FEATURES:

- Guaranteed Low Skew < 25ps (max)
- Very low duty cycle distortion < 125ps (max)
- High speed propagation delay < 1.75ns (max)
- Additive phase jitter, RMS 0.159ps (typical) @ 125MHz
- Up to 1GHz operation
- Selectable inputs
- Hot insertable and over-voltage tolerant inputs
- 3.3V / 2.5V LVTTTL, HSTL, eHSTL, LVEPECL (2.5V), LVPECL (3.3V), CML, or LVDS input interface
- Selectable differential inputs to six LVDS outputs
- Power-down mode
- 2.5V V_{DD}
- Available in VFQFPN package

APPLICATIONS:

- Clock distribution

DESCRIPTION:

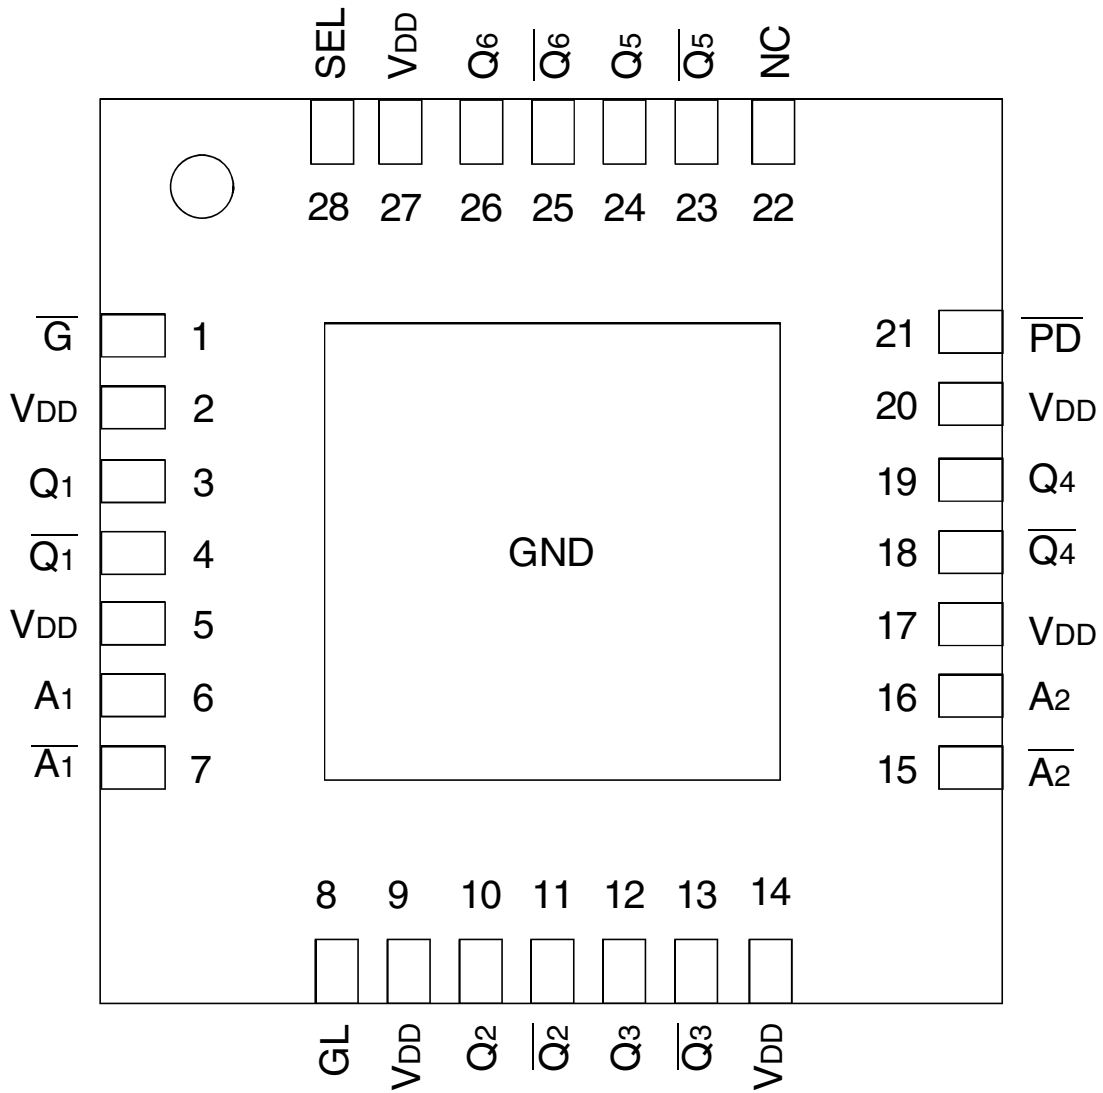

The IDT5T9306 2.5V differential clock buffer is a user-selectable differential input to six LVDS outputs. The fanout from a differential input to six LVDS outputs reduces loading on the preceding driver and provides an efficient clock distribution network. The IDT5T9306 can act as a translator from a differential HSTL, eHSTL, LVEPECL (2.5V), LVPECL (3.3V), CML, or LVDS input to LVDS outputs. A single-ended 3.3V / 2.5V LVTTTL input can also be used to translate to LVDS outputs. The redundant input capability allows for an asynchronous change-over from a primary clock source to a secondary clock source. Selectable reference inputs are controlled by SEL.

The IDT5T9306 outputs can be asynchronously enabled/disabled. When disabled, the outputs will drive to the value selected by the GL pin. Multiple power and grounds reduce noise.

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Not to exceed 3.6V.

PIN DESCRIPTION

Symbol	I/O	Type	Description
A _[1:2]	I	Adjustable ^(1,4)	Clock input. A _[1:2] is the "true" side of the differential clock input.
\bar{A} _[1:2]	I	Adjustable ^(1,4)	Complementary clock inputs. \bar{A} _[1:2] is the complementary side of A _[1:2] . For LVTTTL single-ended operation, \bar{A} _[1:2] should be set to the desired toggle voltage for A _[1:2] : 3.3V LVTTTL V _{REF} = 1650mV 2.5V LVTTTL V _{REF} = 1250mV
\bar{G}	I	LVTTTL	Gate control for differential outputs Q ₁ and \bar{Q} ₁ through Q ₆ and \bar{Q} ₆ . When \bar{G} is LOW, the differential outputs are active. When \bar{G} is HIGH, the differential outputs are asynchronously driven to the level designated by GL ⁽²⁾ .
GL	I	LVTTTL	Specifies output disable level. If HIGH, "true" outputs disable HIGH and "complementary" outputs disable LOW. If LOW, "true" outputs disable LOW and "complementary" outputs disable HIGH.
Q _n	O	LVDS	Clock outputs
\bar{Q} _n	O	LVDS	Complementary clock outputs
SEL	I	LVTTTL	Reference clock select. When LOW, selects A ₂ and \bar{A} ₂ . When HIGH, selects A ₁ and \bar{A} ₁ .
\bar{P} _D	I	LVTTTL	Power-down control. Shuts off entire chip. If LOW, the device goes into low power mode. Inputs and outputs are disabled. Both "true" and "complementary" outputs will pull to V _{DD} . Set HIGH for normal operation. ⁽³⁾
V _{DD}		PWR	Power supply for the device core and inputs
GND		PWR	Power supply return for all power
N C			No connect; recommended to connect to GND

NOTES:

- Inputs are capable of translating the following interface standards:
Single-ended 3.3V and 2.5V LVTTTL levels
Differential HSTL and eHSTL levels
Differential LVEPECL (2.5V) and LVPECL (3.3V) levels
Differential LVDS levels
Differential CML levels
- Because the gate controls are asynchronous, runt pulses are possible. It is the user's responsibility to either time the gate control signals to minimize the possibility of runt pulses or be able to tolerate them in down stream circuitry.
- It is recommended that the outputs be disabled before entering power-down mode. It is also recommended that the outputs remain disabled until the device completes power-up after asserting \bar{P} _D.
- The user must take precautions with any differential input interface standard being used in order to prevent instability when there is no input signal.

D _H	Duty Cycle	50	%
V _{THI}	Input Timing Measurement Reference Level ⁽³⁾	Crossing Point	V
t _R , t _F	Input Signal Edge Rate ⁽⁴⁾	2	V/ns

NOTES:

1. The 732mV peak-to-peak input pulse level is specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. This device meets the V_{DIF} (AC) specification under actual use conditions.
2. 1082mV LVEPECL (2.5V) and 1880mV LVPECL (3.3V) crossing point levels are specified to allow consistent, repeatable results in an automatic test equipment (ATE) environment. This device meets the V_X specification under actual use conditions.
3. In all cases, input waveform timing is marked at the differential cross-point of the input signals.
4. The input signal edge rate of 2V/ns or greater is to be maintained in the 20% to 80% range of the input waveform.

DIFFERENTIAL INPUT AC TEST CONDITIONS FOR LVDS

V _{CM}	Common Mode Input Voltage Range ⁽³⁾	0.05	—	V _{DD}	V
V _{IN}	Input Voltage	-0.3		+3.6	V

NOTES:

1. The output will not change state until the inputs have crossed and the minimum differential voltage range defined by V_{DIF} has been met or exceeded.
2. V_{DIF} specifies the minimum input voltage (V_{TR} - V_{CP}) required for switching where V_{TR} is the "true" input level and V_{CP} is the "complement" input level. The AC differential voltage must be achieved to guarantee switching to a new state.
3. V_{CM} specifies the maximum allowable range of (V_{TR} + V_{CP}) / 2.

NOTES:

1. AC propagation measurements should not be taken within the first 100 cycles of startup.
2. Skew measured between crosspoints of all differential output pairs under identical input and output interfaces, transitions and load conditions on any one device.
3. Skew measured is the difference between propagation delay times t_{PHL} and t_{PLH} of any differential output pair under identical input and output interfaces, transitions and load conditions on any one device.
4. Skew measured is the magnitude of the difference in propagation times between any single differential output pair of two devices, given identical transitions and load conditions at identical V_{DD} levels and temperature.
5. All parameters are tested with a 50% input duty cycle.
6. Guaranteed by design but not production tested.

DIFFERENTIAL AC TIMING WAVEFORMS

Output Propagation and Skew Waveforms

NOTES:

1. Pulse skew is calculated using the following expression:

$$t_{SK(P)} = |t_{PHL} - t_{PLH}|$$

Note that the t_{PHL} and t_{PLH} shown above are not valid measurements for this calculation because they are not taken from the same pulse.

2. AC propagation measurements should not be taken within the first 100 cycles of startup.

Differential Gate Disable/Enable Showing Runt Pulse Generation

NOTE:

1. As shown, it is possible to generate runt pulses on gate disable and enable of the outputs. It is the user's responsibility to time the \bar{G} signal to avoid this problem.

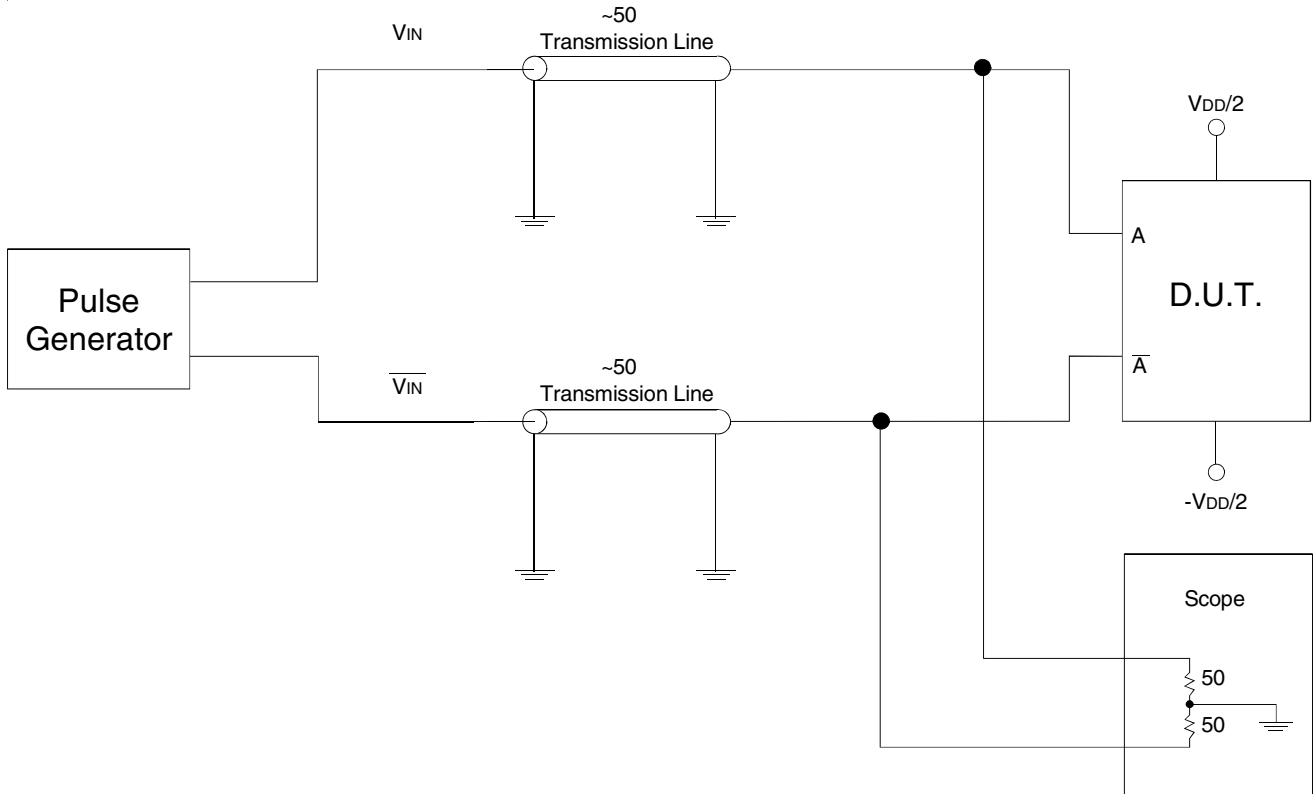

Power Down Timing

NOTES:

1. It is recommended that outputs be disabled before entering power-down mode. It is also recommended that the outputs remain disabled until the device completes power-up after asserting \bar{PD} .
2. The POWER DOWN TIMING diagram assumes that GL is HIGH.
3. It should be noted that during power-down mode, the outputs are both pulled to V_{DD} . In the POWER DOWN TIMING diagram this is shown when $Q_n - \bar{Q}_n$ goes to $V_{DIF} = 0$.

NOTES:

1. Specifications only apply to "Normal Operations" test condition. The T_{IA}/E_{IA} specification load is for reference only.
2. The scope inputs are assumed to have a 2pF load to ground. T_{IA}/E_{IA} - 644 specifies 5pF between the output pair. With $C_L = 8pF$, this gives the test circuit appropriate 5pF equivalent load.

VFQFPN EPAD THERMAL RELEASE PATH

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 1*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as "heat pipes". The number of vias (i.e.

"heat pipes") are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, refer to the Application Note on the *Surface Mount Assembly* of Amkor's Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.
