

# LOW SKEW, 1-TO-4, CRYSTAL OSCILLATOR/LVCMOS-TO-3.3V LVPECL/LVCMOS FANOUT BUFFER

ICS8534I-13

## GENERAL DESCRIPTION

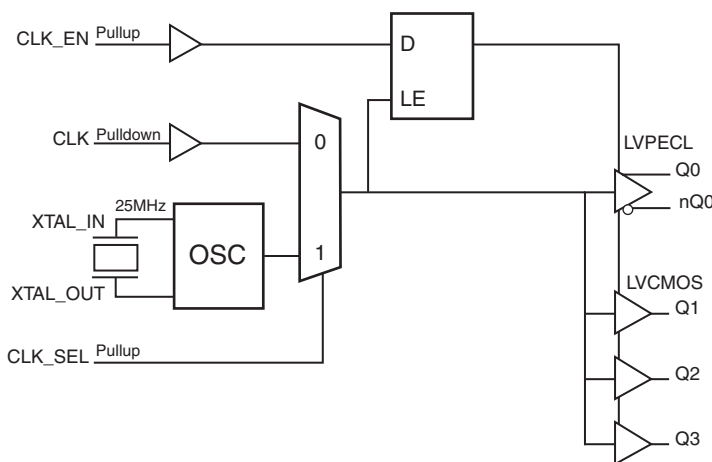

The ICS8534I-13 is a low skew, high performance 1-to-4 Crystal Oscillator/LVCMOS-to-3.3V LVPECL/LVCMOS fanout buffer and a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. The ICS8534I-13 has selectable single ended clock or crystal inputs. The single ended clock input accepts LVCMOS or LVTTTL input levels and translate them to 3.3V LVPECL levels. The output enable is internally synchronized to eliminate runt pulses on the outputs during asynchronous assertion/deassertion of the clock enable pin.

Guaranteed output and part-to-part skew characteristics make the ICS8534I-13 ideal for those applications demanding well defined performance and repeatability.

## FEATURES

- One differential 3.3V LVPECL outputs, and three single ended 2.5V LVCMOS outputs
- Selectable LVCMOS/LVTTTL CLK or crystal inputs
- CLK can accept the following input levels: LVCMOS, LVTTTL
- Crystal frequency: 25MHz
- Maximum output frequency: 266MHz
- Output skew: 55ps (typical)
- Part-to-part skew: 800ps (typical)
- Propagation delay: 3.3ns (typical)
- Additive phase jitter, RMS: 0.16ps (typical)
- LVPECL output, 3.3V operating supply  
LVCMOS output, 2.5V operating supply
- -40°C to 85°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free RoHS 6) packages

The Preliminary Information presented herein represents a product in pre-production. The noted characteristics are based on initial product characterization and/or qualification. Integrated Device Technology, Incorporated (IDT) reserves the right to change any circuitry or specifications without notice.

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1	CLK_EN	Input	Pullup	Synchronizing clock enable. When HIGH, clock outputs follows clock input. When LOW, Q outputs are forced low, nQ0 output is forced high. LVCMOS / LVTTTL interface levels.
2, 3	XTAL_IN, XTAL_OUT	Input		Crystal oscillator interface. XTAL_IN is the input. XTAL_OUT is the output.
4	V <sub>CC</sub>	Power		Positive supply pin.
5	CLK	Input	Pulldown	Clock input. LVCMOS / LVTTTL interface levels.
6	CLK_SEL	Input	Pullup	Clock select input. When HIGH, selects XTAL inputs. When LOW, selects CLK input. LVCMOS / LVTTTL interface levels.
7, 12	V <sub>EE</sub>	Power		Negative supply pins.
8	V <sub>CCO_LVPECL</sub>	Power		Output power supply mode for LVPECL clock outputs.
9, 10	Q0, nQ0	Output		Differential clock outputs. LVPECL interface levels.
11	nc	Unused		No connect.
13, 15, 16	Q1, Q2, Q3	Output		Single ended clock outputs. LVCMOS / LVTTTL interface levels.
14	V <sub>CCO_LVCMOS</sub>	Power		Output power supply mode for LVCMOS / LVTTTL clock outputs.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

TABLE 2. PIN CHARACTERISTICS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C <sub>IN</sub>	Input Capacitance			4		pF
C <sub>PD</sub>	Power Dissipation Capacitance (per output)			TBD		pF
R <sub>PULLUP</sub>	Input Pullup Resistor			51		kΩ
R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		kΩ
R <sub>OUT</sub>	Output Impedance			15		Ω

TABLE 3A. CONTROL INPUT FUNCTION TABLE

Inputs			Outputs		
CLK_EN	CLK_SEL	Selected Source	Q0	nQ0	Q1:Q3
0	0	CLK	Disabled; LOW	Disabled; HIGH	Disabled; LOW
0	1	XTAL_IN, XTAL_OUT	Disabled; LOW	Disabled; HIGH	Disabled; LOW
1	0	CLK	Enabled	Enabled	Enabled
1	1	XTAL_IN, XTAL_OUT	Enabled	Enabled	Enabled

After CLK\_EN switches, the clock outputs are disabled or enabled following a rising and falling input clock or crystal oscillator edge as shown in Figure 1.

In the active mode, the state of the outputs are a function of the CLK input as described in Table 3B.

FIGURE 1. CLK\_EN TIMING DIAGRAM

CLK	Q0	nQ0	Q1:Q3
0	LOW	HIGH	LOW
1	HIGH	LOW	HIGH

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage, $V_{CC}$	4.6V
Inputs, $V_I$ (LVCMOS)	-0.5V to $V_{CC} + 0.5V$
Outputs, $V_O$ (LVCMOS)	-0.5V to $V_{CCO\_LVCMOS} + 0.5V$
Inputs, $V_I$ (LVPECL)	-0.5V to $V_{CC} + 0.5V$
Outputs, $I_O$ (LVPECL)	
Continuous Current	50mA
Surge Current	100mA
Package Thermal Impedance, $\theta_{JA}$	90°C/W (0 lfpm)
Storage Temperature, $T_{STG}$	-65°C to 150°C

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

**TABLE 4A. LVPECL POWER SUPPLY DC CHARACTERISTICS,  $V_{CC} = V_{CCO\_LVPECL} = 3.3V \pm 5\%$ ,  $T_A = -40^\circ\text{C}$  TO  $85^\circ\text{C}$**

TABLE 5. CRYSTAL CHARACTERISTICS

Parameter	Test Conditions	Minimum	Typical	Maximum	Units
Mode of Oscillation		Fundamental			
Frequency		12		40	MHz
Equivalent Series Resistance (ESR)				50	$\Omega$
Shunt Capacitance				7	pF
Drive Level				1	mW

TABLE 6A. AC CHARACTERISTICS,  $V_{CC} = V_{CCO\_LVPECL} = 3.3V \pm 5\%$ ,  $T_A = -40^\circ\text{C}$  TO  $85^\circ\text{C}$ 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$f_{MAX}$	Output Frequency				266	MHz
$t_{PD}$	Propagation Delay; NOTE 1			1.65		ns
$t_{jit}$	Buffer Additive Phase Jitter, RMS; refer to Additive Phase Jitter Section	155.52MHz, (Integration Range: 12kHz - 20MHz)		0.16		ps
$t_{sk(o)}$	Output Skew; NOTE 2, 4			55		ps
$t_{sk(pp)}$	Part-to-Part Skew; NOTE 3, 4			800		ps
$t_R / t_F$	Output Rise/Fall Time	20% to 80%		450		ps
odc	Output Duty Cycle			50		%

All parameters measured at  $f \leq 266\text{MHz}$  unless noted otherwise.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the output differential cross points.

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

TABLE 6B. AC CHARACTERISTICS,  $V_{CC} = V_{CCO\_LVCMOS} = 2.5V \pm 5\%$ ,  $T_A = -40^\circ\text{C}$  TO  $85^\circ\text{C}$ 

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$f_{MAX}$	Output Frequency				266	MHz
$t_{PD}$	Propagation Delay; NOTE 1			3.3		ns
$t_{jit}$	Buffer Additive Phase Jitter, RMS; refer to Additive Phase Jitter Section	155.52MHz, (Integration Range: 12kHz - 20MHz)		0.21		ps
$t_{sk(o)}$	Output Skew; NOTE 2, 4			55		ps
$t_{sk(pp)}$	Part-to-Part Skew; NOTE 3, 4			800		ps
$t_R / t_F$	Output Rise/Fall Time	20% to 80%		550		ps
odc	Output Duty Cycle			50		%

All parameters measured at  $f \leq 266\text{MHz}$  unless noted otherwise.

NOTE 1: Measured from  $V_{CC}$  of the input to  $V_{CCO\_LVCMOS}$  of the output.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at  $V_{CCO\_LVCMOS}$ .

NOTE 3: Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at  $V_{CCO\_LVCMOS}$ .

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

## ADDITIVE PHASE JITTER

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in the 1Hz

band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the

device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependant on the input source and measurement equipment.

## APPLICATION INFORMATION

### RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

#### INPUTS:

##### CRYSTAL INPUTS

For applications not requiring the use of the crystal oscillator input, both XTAL\_IN and XTAL\_OUT can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from XTAL\_IN to ground.

##### CLK INPUT

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from the CLK input to ground.

##### LVCMOS CONTROL PINS

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1k $\Omega$  resistor can be used.

#### OUTPUTS:

##### LVCMOS OUTPUTS

All unused LVCMOS output can be left floating. We recommend that there is no trace attached.

##### LVPECL OUTPUT

The unused LVPECL output can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

### CRYSTAL INPUT INTERFACE

The ICS8534I-13 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using an 18pF parallel resonant crystal and were chosen to minimize the ppm error. These same

capacitor values will tune any 18pF parallel resonant crystal over the frequency range and other parameters specified in this data sheet. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

FIGURE 2. CRYSTAL INPUT INTERFACE

### LVCMOS TO XTAL INTERFACE

The XTAL\_IN input can accept a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure X*. The XTAL\_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVCMOS inputs, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver ( $R_o$ ) plus the series resistance ( $R_s$ ) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First,  $R_1$  and  $R_2$  in parallel should equal the transmission line impedance. For most 50Ω applications,  $R_1$  and  $R_2$  can be 100Ω. This can also be accomplished by removing  $R_1$  and making  $R_2$  50Ω.

FIGURE 3. GENERAL DIAGRAM FOR LVCMOS DRIVER TO XTAL INPUT INTERFACE

### TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive

50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 4A. LVPECL OUTPUT TERMINATION

FIGURE 4B. LVPECL OUTPUT TERMINATION

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS8534I-13. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS8534I-13 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

#### Core and LVPECL Output Power Dissipation

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 60mA = 207.9mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**

#### LVCMOS Output Power Dissipation

- Output Impedance  $R_{OUT}$  Power Dissipation due to Loading  $50\Omega$  to  $V_{CC\_LVCMOS}/2$   
Output Current  $I_{OUT} = V_{CC\_MAX} / [2 * (50\Omega + R_{OUT})] = 2.625V / [2 * (50\Omega + 15\Omega)] = 20.2mA$
- Power Dissipation on the  $R_{OUT}$  per LVCMOS output  
Power ( $R_{OUT}$ ) =  $R_{OUT} * (I_{OUT})^2 = 15\Omega * (20.2mA)^2 = 6.12mW$  per output
- Total Power Dissipation on the  $R_{OUT}$   
**Total Power ( $R_{OUT}$ ) =  $6.12mW * 3 = 18.4mW$**
- Dynamic Power Dissipation at 25MHz  
**Power (25MHz) =  $C_{PD} * frequency * (V_{DDO})^2 = 15pF * 25MHz * (2.625V)^2 = 2.58mW$  per output**  
**Total Power (25MHz) =  $2.58mW * 3 = 7.75mW$**

#### Total Power Dissipation

- **Total Power**  
= Power (LVPECL) + Total Power ( $R_{OUT}$ ) + Total Power (25MHz)  
=  $207.9mW + 30mW + 18.4mW + 7.75mW$   
= **264mW**

## 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd_{total} + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd_{total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 90°C/W per Table 7 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$85^\circ\text{C} + 0.264\text{W} * 90^\circ\text{C}/\text{W} = 108.8^\circ\text{C}$ . This is well below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 7. THERMAL RESISTANCE  $\theta_{JA}$  FOR 16-PIN SOIC, FORCED CONVECTION**
