Spread-Spectrum Crystal Multiplier

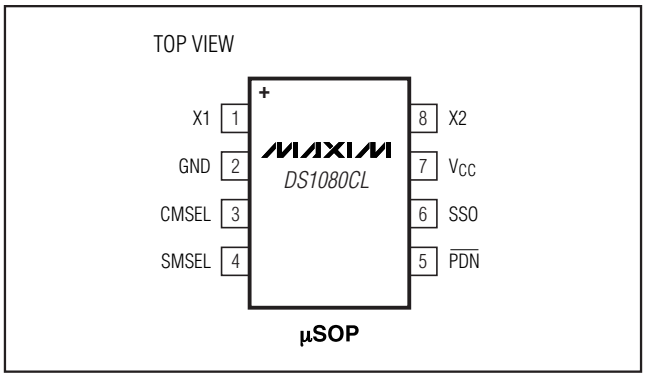
General Description

The DS1080CL is a low-jitter, crystal-based clock generator with an integrated phase-locked loop (PLL) to generate spread-spectrum clock outputs from 8MHz to 64MHz. The device is pin programmable to select the clock multiplier rate as well as the dither magnitude. The DS1080CL has a spread-spectrum disable mode and a power-down mode to conserve power.

Applications

Automotive	Copiers
Cable Modems	Infotainment
Cell Phones	PCs
Computer Peripherals	Printers

Pin Configuration



Features

- Generates Spread-Spectrum Clocks from 8MHz to 64MHz
- Selectable Clock Multiplier Rates of 1x, 2x, and 4x
- Center Spread-Spectrum Dithering
- Selectable Spread-Spectrum Modulation Magnitudes of ±0.5%, ±1.0%, and ±1.5%
- Spread-Spectrum Disable Mode
- Low Cycle-to-Cycle Jitter
- Power-Down Mode with High-Impedance Output
- Low Cost
- Low-Power Consumption
- 3.0V to 3.6V Single-Supply Operation
- -40°C to +125°C Temperature Operation
- Small 8-Pin µSOP Package

ABSOLUTE MAXIMUM RATINGS

Voltage Range on V_{CC} Relative to GND .....-0.5V to +3.63V
Voltage Range on Any Pin Relative to GND .....-0.5V to (V_{CC} + 0.5V), not to exceed +3.63V
Operating Temperature Range .....-40°C to +125°C
Storage Temperature Range .....-55°C to +125°C
Soldering Temperature.....Refer to the IPC/JEDEC J-STD-020 Specification.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Spread-Spectrum Crystal Multiplier

Detailed Description

The DS1080CL is a crystal multiplier with center spread-spectrum capability. An 8MHz to 16MHz crystal is connected to the X1 and X2 pins. Alternately, an 8MHz to 16MHz clock can be applied to X1 in place of the crystal. In such applications, X2 would be left open circuit. Using the CMSEL input, the user selects whether the attached crystal or input clock is multiplied by 1, 2, or 4. The DS1080CL can generate spread-spectrum clocks from 8MHz to 64MHz.

The PLL can dither the output clock about its center frequency at a user-selectable magnitude. Using the SMSEL input, the user selects the dither magnitude. The $\overline{PDN}$ input can be used to place the device into a low-power standby mode where the SSO output is high impedance. If the $\overline{PDN}$ pin is floated, the SSO output is active but the spread-spectrum dithering is disabled. The spread-spectrum dither rate is fixed at $f_{IN}/512$ to keep the dither rate above the audio frequency range. On power-up, the output clock (SSO) remains high impedance until the PLL reaches a stable frequency (f_{SSO}) and dither (f_{DITHER}). A power cycle is needed for the PLL whenever there is a change in input frequency, CMSEL, or SMSEL.

Applications Information

Crystal Selection

The DS1080CL requires a parallel resonating crystal operating in the fundamental mode, with an ESR of less than 90Ω. The crystal should be placed very close to the device to minimize excessive loading due to parasitic capacitances.

Oscillator Input

When driving the DS1080CL using an external oscillator clock, consider the input (X1) to be high impedance.

Crystal Capacitor Selection

The load capacitors C_{L1} and C_{L2} are selected based on the crystal specifications (from the data sheet of the crystal used). The crystal parallel load capacitance is calculated as follows:

$$C_L = \frac{C_{L1} \times C_{L2}}{C_{L1} + C_{L2}} + C_{IN} \quad \textbf{(1)}$$

For the DS1080CL use $C_{L1} = C_{L2} = C_{LX}$.

In this case, the equation then reduces to:

$$C_L = \frac{C_{LX}}{2} + C_{IN} \quad \textbf{(2)}$$

where $C_{L1} = C_{L2} = C_{LX}$.

Equation 2 is used to calculate the values of C_{L1} and C_{L2} based on values of C_L and C_{IN} noted in the electrical specifications.

Power-Supply Decoupling

To achieve best results, it is highly recommended that a decoupling capacitor is used on the IC power-supply pins. Typical values of decoupling capacitors are 0.001µF and 0.1µF. Use a high-quality, ceramic, surface-mount capacitor, and mount it as close as possible to the V_{CC} and GND pins of the IC to minimize lead inductance.

Layout Considerations

As noted earlier, the crystal should be placed very close to the device to minimize excessive loading due to parasitic capacitances. Care should also be taken to minimize loading on pins that could be floated as a programming option (SMSEL and CMSEL). Coupling on inputs due to clocks should be minimized.
