

Low Noise, Low Power, I²C™ Bus, 128 Taps

The ISL22326 integrates two digitally controlled potentiometers (XDCP) and non-volatile memory on a monolithic CMOS integrated circuit.

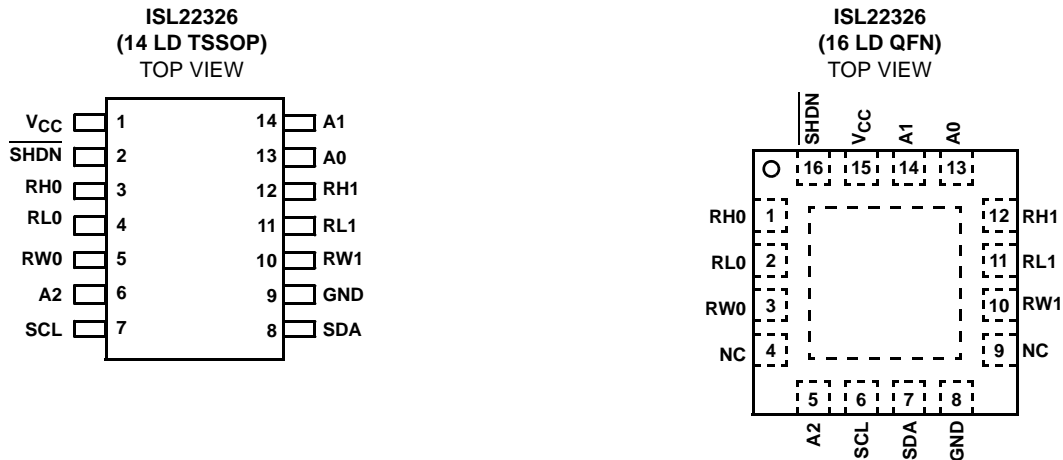

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the I²C bus interface. Each potentiometer has an associated volatile Wiper Register (WR) and a non-volatile Initial Value Register (IVR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper. At power-up the device recalls the contents of the two DCP's IVR to the corresponding WRs.

The DCPs can be used as three-terminal potentiometers or as two-terminal variable resistors in a wide variety of applications including control, parameter adjustments, and signal processing.

Features

- Two potentiometers in one package
- 128 resistor taps
- I²C serial interface
 - Three address pins, up to eight devices/bus
- Non-volatile storage of wiper position
- Wiper resistance: 70Ω typical @ V_{CC} = 3.3V
- Shutdown mode
- Shutdown current 5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ or 10kΩ total resistance
- High reliability
 - Endurance: 1,000,000 data changes per bit per register
 - Register data retention: 50 years @ T ≤ +55°C
- 14 Ld TSSOP or 16 Ld QFN package
- Pb-free (RoHS compliant)

Pinouts

Ordering Information

PART NUMBER (Note)	PART MARKING	RESISTANCE OPTION (kΩ)	TEMP. RANGE (°C)	PACKAGE (Pb-free)	PKG. DWG. #
ISL22326UFV14Z*	22326 UFVZ	50	-40 to +125	14 Ld TSSOP	M14.173
ISL22326UFR16Z*	223 26UFZ	50	-40 to +125	16 Ld 4x4 QFN	L16.4x4A
ISL22326WV14Z*	22326 WVFZ	10	-40 to +125	14 Ld TSSOP	M14.173
ISL22326WFR16Z*	223 26WFZ	10	-40 to +125	16 Ld 4x4 QFN	L16.4x4A

*Add "-TK" suffix for tape and reel. Please refer to TB347 for details on reel specifications.

NOTE: These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

Block Diagram

Pin Descriptions

TSSOP PIN NUMBER	QFN PIN NUMBER	PIN NAME	DESCRIPTION
1	15	V _{CC}	Power supply pin
2	16	SHDN	Shutdown active low input
3	1	RH0	“High” terminal of DCP0
4	2	RL0	“Low” terminal of DCP0
5	3	RW0	“Wiper” terminal of DCP0
6	5	A2	Device address input for the I ² C interface
7	6	SCL	Open drain I ² C interface clock input
8	7	SDA	Open drain Serial data I/O for the I ² C interface
9	8	GND	Device ground pin
10	10	RW1	“Wiper” terminal of DCP1
11	11	RL1	“Low” terminal of DCP1
12	12	RH1	“High” terminal of DCP1
13	13	A0	Device address input for the I ² C interface
14	14	A1	Device address input for the I ² C interface
	4, 9	NC	No connection
	EPAD*		Exposed Die Pad internally connected to GND

*Note: PCB thermal land for QFN EPAD should be connected to GND plane or left floating. For more information refer to <http://www.intersil.com/data/tb/TB389.pdf>

Absolute Maximum Ratings

Storage Temperature -65°C to +150°C
 Voltage at any Digital Interface Pin
 with Respect to GND -0.3V to V_{CC} + 0.3
 V_{CC} -0.3V to +6V
 Voltage at any DCP Pin with Respect to GND -0.3V to V_{CC}
 I_W (10s) ±6mA
 Latchup (Note 3) Class II, Level B @ +125°C
ESD Ratings
 Human Body Model 2.5kV
 Machine Model 350V

Thermal Information

Thermal Resistance (Typical, Notes 1, 2) θ_{JA} (°C/W) θ_{JC} (°C/W)
 14 Lead TSSOP 100 N/A
 16 Lead QFN 40 3.0
 Maximum Junction Temperature (Plastic Package) +150°C
 Pb-free Reflow Profile see link below

Recommended Operating Conditions

Temperature Range (Extended Industrial) -40°C to +125°C
 V_{CC} 2.7V to 5.5V
 Power Rating 15mW
 Wiper Current ±3.0mA

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

1. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
2. For θ_{JC}, the “case temp” location is the center of the exposed metal pad on the package underside.
3. Jedec Class II pulse conditions and failure criterion used. Level B exceptions are: using a max positive pulse of 6.5V on the SHDN pin, and using a max negative pulse of -0.8V for all pins.

Analog Specifications Over recommended operating conditions, unless otherwise stated.

NOTES:

4. Typical values are for T_A = +25°C and 3.3V supply voltage
5. LSB: $[V(R_W)_{127} - V(R_W)_0]/127$. V(R_W)₁₂₇ and V(R_W)₀ are V(R_W) for the DCP register set to 7F hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
6. ZS error = V(R_W)₀/LSB.
7. FS error = $[V(R_W)_{127} - V_{CC}]/LSB$.
8. DNL = $[V(R_W)_i - V(R_W)_{i-1}]/LSB - 1$, for i = 1 to 127. i is the DCP register setting.
9. INL = $[V(R_W)_i - i \cdot LSB - V(R_W)_0]/LSB$ for i = 1 to 127.
10. V_{MATCH} = $[V(R_Wx)_i - V(R_Wy)_i]/LSB$, for i = 1 to 127, x = 0 to 1 and y = 0 to 1.
11. $TC_V = \frac{\text{Max}(V(R_W)_i) - \text{Min}(V(R_W)_i)}{[\text{Max}(V(R_W)_i) + \text{Min}(V(R_W)_i)]/2} \times \frac{10^6}{+165^\circ\text{C}}$ for i = 16 to 112 decimal, T = -40°C to +125°C. Max() is the maximum value of the wiper voltage and Min() is the minimum value of the wiper voltage over the temperature range.
12. MI = $|RW_{127} - RW_0|/127$. MI is a minimum increment. RW₁₂₇ and RW₀ are the measured resistances for the DCP register set to 7F hex and 00 hex respectively.
13. R_{offset} = RW₀/MI, when measuring between RW and RL.
R_{offset} = RW₁₂₇/MI, when measuring between RW and RH.
14. RDNL = $(RW_i - RW_{i-1})/MI - 1$, for i = 16 to 127.
15. RINL = $[RW_i - (MI \cdot i) - RW_0]/MI$, for i = 16 to 127.
16. R_{MATCH} = $(RW_{i,x} - RW_{i,y})/MI$, for i = 1 to 127, x = 0 to 1 and y = 0 to 1.
17. $TC_R = \frac{[\text{Max}(R_i) - \text{Min}(R_i)]}{[\text{Max}(R_i) + \text{Min}(R_i)]/2} \times \frac{10^6}{+165^\circ\text{C}}$ for i = 16 to 112, T = -40°C to +125°C. Max() is the maximum value of the resistance and Min() is the minimum value of the resistance over the temperature range.
18. t_{WC} is the time from a valid STOP condition at the end of a Write sequence of I²C serial interface, to the end of the self-timed internal non-volatile write cycle.
19. Limits should be considered typical and are not production tested.
20. Parameters with MIN and/or MAX limits are 100% tested at +25°C, unless otherwise specified. Temperature limits established by characterization and are not production tested.

Pin Descriptions

Potentiometers Pins

RHI AND RLI (i = 0, 1)

The high (RHi) and low (RLi) terminals of the ISL22326 are equivalent to the fixed terminals of a mechanical potentiometer. RHi and RLi are referenced to the relative position of the wiper and not the voltage potential on the terminals. With WRi set to 127 decimal, the wiper will be closest to RHi, and with the WRi set to 0, the wiper is closest to RLi.

RWi (i = 0,1)

RWi is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the WRi register.

SHDN

The $\overline{\text{SHDN}}$ pin forces the resistor to end-to-end open circuit condition on RHi and shorts RWi to RLi. When $\overline{\text{SHDN}}$ is returned to logic high, the previous latch settings put RWi at the same resistance setting prior to shutdown. This pin is logically ANDed with SHDN bit in ACR register. I²C interface is still available in shutdown mode and all registers are accessible. This pin must remain HIGH for normal operation.

FIGURE 15. DCP CONNECTION IN SHUTDOWN MODE

Bus Interface Pins

SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bidirectional serial data input/output pin for I²C interface. It receives device address, operation code, wiper address and data from an I²C external master device at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock.

SDA requires an external pull-up resistor, since it is an open drain input/output.

SERIAL CLOCK (SCL)

This is the serial clock input of the I²C serial interface. SCL requires an external pull-up resistor, since it is an open drain input.

DEVICE ADDRESS (A2 - A0)

The address inputs are used to set the least significant 3 bits of the 7-bit I²C interface slave address. A match in the slave address serial data stream must match with the Address input pins in order to initiate communication with the ISL22326. A maximum of 8 ISL22326 devices may occupy the I²C serial bus.

Principles of Operation

The ISL22326 is an integrated circuit incorporating two DCPs with their associated registers, non-volatile memory and an I²C serial interface providing direct communication between a host and the potentiometers and memory. The resistor arrays are comprised of individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The electronic switches on the device operate in a “make before break” mode when the wiper changes tap positions.

When the device is powered down, the last value stored in IVRi will be maintained in the non-volatile memory. When power is restored, the contents of the IVRi are recalled and loaded into the corresponding WRi to set the wipers to the initial value.

DCP Description

Each DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of each DCP are equivalent to the fixed terminals of a mechanical potentiometer (RH and RL pins). The RW pin of each DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by volatile Wiper Register (WR). Each DCP has its own WR. When the WR of a DCP contains all zeroes (WR[6:0]= 00h), its wiper terminal (RW) is closest to its “Low” terminal (RL). When the WR register of a DCP contains all ones (WR[6:0] = 7Fh), its wiper terminal (RW) is closest to its “High” terminal (RH). As the value of the WR increases from all zeroes (0) to all ones (127 decimal), the wiper moves monotonically from the position closest to RL to the closest to RH. At the same time, the resistance between RW and RL increases monotonically, while the resistance between RH and RW decreases monotonically.

While the ISL22326 is being powered up, all WRs are reset to 40h (64 decimal), which locates RW roughly at the center between RL and RH. After the power supply voltage becomes large enough for reliable non-volatile memory reading, all WRs will be reload with the value stored in corresponding non-volatile Initial Value Registers (IVRs).

The WRs can be read or written to directly using the I²C serial interface as described in the following sections. The I²C interface Address Byte has to be set to 00h or 01h to access the WR of DCP0 or DCP1 respectively.

Memory Description

The ISL22326 contains seven non-volatile and three volatile 8-bit registers. Memory map of ISL22326 is on Table 1. The two non-volatile registers (IVRi) at address 0 and 1, contain initial wiper value and volatile registers (WRi) contain current wiper position. In addition, five non-volatile General Purpose registers from address 2 to address 6 are available.

TABLE 1. MEMORY MAP

ADDRESS	NON-VOLATILE	VOLATILE
8	—	ACR
7	Reserved	
6	General Purpose	Not Available
5	General Purpose	Not Available
4	General Purpose	Not Available
3	General Purpose	Not Available
2	General Purpose	Not Available
1	IVR1	WR1
0	IVR0	WR0

The non-volatile IVR_i and volatile WR_i registers are accessible with the same address.

The Access Control Register (ACR) contains information and control bits described in Table 2. The VOL bit at access control register (ACR[7]) determines whether the access is to wiper registers WR_i or initial value registers IVR_i.

TABLE 2. ACCESS CONTROL REGISTER (ACR)

VOL	SHDN	WIP	0	0	0	0	0

If VOL bit is 0, the non-volatile IVR_i registers are accessible. If VOL bit is 1, only the volatile WR_i are accessible. Note, value is written to IVR_i register also is written to the corresponding WR_i. The default value of this bit is 0.

The SHDN bit (ACR[6]) disables or enables Shutdown mode. This bit is logically ANDed with SHDN pin. When this bit is 0, DCP is in Shutdown mode. Default value of SHDN bit is 1.

The WIP bit (ACR[5]) is read only bit. It indicates that non-volatile write operation is in progress. It is impossible to write to the IVR_i, WR_i or ACR while WIP bit is 1.

Shutdown Mode

The device can be put in Shutdown mode either by pulling the SHDN pin to GND or setting the SHDN bit in the ACR register to 0. The truth table for Shutdown mode is in Table 3.

TABLE 3.

SHDN pin	SHDN bit	Mode
High	1	Normal operation
Low	1	Shutdown
High	0	Shutdown
Low	0	Shutdown

I²C Serial Interface

The ISL22326 supports an I²C bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both

transmit and receive operations. Therefore, the ISL22326 operates as a slave device in all applications.

All communication over the I²C interface is conducted by sending the MSB of each byte of data first.

Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (see Figure 16). On power-up of the ISL22326, the SDA pin is in the input mode.

All I²C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL22326 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (see Figure 16). A START condition is ignored during the power-up of the device.

All I²C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (see Figure 16). A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (see Figure 17).

The ISL22326 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL22326 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

A valid Identification Byte contains 1010 as the four MSBs, and the following three bits matching the logic values present at pins A2, A1, and A0. The LSB is the Read/Write bit. Its value is "1" for a Read operation, and "0" for a Write operation (see Table 4).

FIGURE 18. BYTE WRITE SEQUENCE

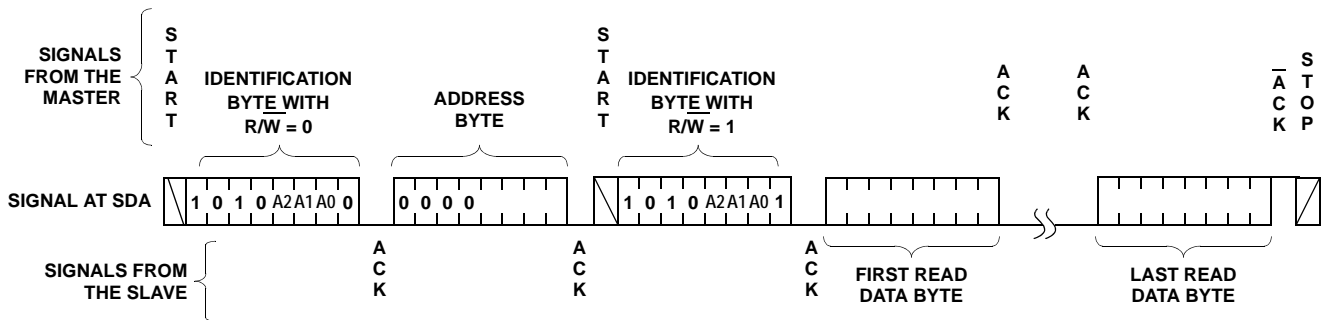

FIGURE 19. READ SEQUENCE

Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL22326 responds with an ACK. At this time, the device enters its standby state (see Figure 18). The device can receive more than one byte of data by auto incrementing the address after each received byte. Note after reaching the address 08h, the internal pointer “rolls over” to address 00h.

The non-volatile write cycle starts after STOP condition is determined and it requires up to 20ms delay for the next non-volatile write. Thus, non-volatile registers must be written individually.

Read Operation

A Read operation consist of a three byte instruction followed by one or more Data Bytes (see Figure 19). The master initiates the operation issuing the following sequence: a START, the Identification byte with the R/W bit set to “0”, an Address Byte, a second START, and a second Identification byte with the R/W bit set to “1”. After each of the three bytes, the ISL22326 responds with an ACK. Then the ISL22326 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The master terminates the read operation (issuing a $\overline{\text{ACK}}$ and a STOP condition) following the last bit of the last Data Byte (see Figure 19).

The Data Bytes are from the registers indicated by an internal pointer. This pointer initial value is determined by the Address Byte in the Read operation instruction, and increments by one during transmission of each Data Byte. After reaching the memory location 08h, the pointer “rolls over” to 00h, and the device continues to output data for each ACK received.

In order to read back the non-volatile IVR, it is recommended that the application reads the ACR first to verify the WIP bit is 0. If the WIP bit (ACR[5]) is not 0, the host should repeat its reading sequence again.

**Quad Flat No-Lead Plastic Package (QFN)
Micro Lead Frame Plastic Package (MLFP)**

L16.4x4A

16 LEAD QUAD FLAT NO-LEAD PLASTIC PACKAGE
(COMPLIANT TO JEDEC MO-220-VGGD-10)

SYMBOL	MILLIMETERS			NOTES

NOTES:

1. Dimensioning and tolerancing conform to ASME Y14.5-1994.
2. N is the number of terminals.
3. Nd and Ne refer to the number of terminals on each D and E.
4. All dimensions are in millimeters. Angles are in degrees.
5. Dimension b applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.
6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.
7. Dimensions D2 and E2 are for the exposed pads which provide improved electrical and thermal performance.
8. Nominal dimensions are provided to assist with PCB Land Pattern Design efforts, see Intersil Technical Brief TB389.
9. Features and dimensions A2, A3, D1, E1, P & θ are present when Anvil singulation method is used and not present for saw singulation.
10. Depending on the method of lead termination at the edge of the package, a maximum 0.15mm pull back (L1) maybe present. L minus L1 to be equal to or greater than 0.3mm.

NOTES:

- These package dimensions are within allowable dimensions of JEDEC MO-153-AC, Issue E.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
- Dimension "E1" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.15mm (0.006 inch) per side.
- The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
- "L" is the length of terminal for soldering to a substrate.
- "N" is the number of terminal positions.
- Terminal numbers are shown for reference only.
- Dimension "b" does not include dambar protrusion. Allowable dambar protrusion shall be 0.08mm (0.003 inch) total in excess of "b" dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm (0.0027 inch).
- Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact. (Angles in degrees)

All Intersil U.S. products are manufactured, assembled and tested utilizing ISO9000 quality systems.
