

AD75004

FEATURES

- 4 Complete 12-Bit D/A Functions
- Double-Buffered Latches
- Simultaneous Update of All DACs Possible
- ± 5 V Output Range
- High Stability Bandgap Reference
- Monolithic BiMOS Construction
- Guaranteed Monotonic over Temperature
- 3/4 LSB Linearity Guaranteed over Temperature
- 4 μ s max Settling Time to 0.01%
- Operates with ± 12 V Supplies
- Low Power: 720 mW max Including Reference
- TTL/5 V CMOS Compatible Logic Inputs
- 8-Bit Microprocessor Interface
- 24-Pin PDIP or 28-Lead PLCC Package

PRODUCT DESCRIPTION

The AD75004 contains four complete, voltage output, 12-bit digital-to-analog converters, a high stability bandgap reference, and double-buffered input latches on a single chip. The converters use 12 precision high speed bipolar current steering switches and laser-trimmed thin-film resistor networks to provide fast settling time and high accuracy.

Microprocessor compatibility is achieved by the on-chip double-buffered latches. The design of the input latches allows direct interface to 8-bit buses. The 12 bits of data from the first rank of latches can then be transferred to the second rank, avoiding generation of spurious analog output values. The latch responds to strobe pulses as short as 50 ns, allowing use with fast microprocessors.

The functional completeness and high performance of the AD75004 results from a combination of advanced switch design, the BiMOS II fabrication process, and proven laser trimming technology. BiMOS II is an epitaxial BiCMOS process optimized for analog and converter functions. The AD75004 is trimmed at the wafer level and is specified to $\pm 1/2$ LSB maximum linearity error at 25°C and $\pm 3/4$ LSB over the full operating temperature range. The on-chip output amplifiers provide an output range of ± 5 V, with 1 LSB equal to 2.44 mV.

FUNCTIONAL BLOCK DIAGRAM

The bandgap reference on the chip has low noise, long term stability and temperature drift characteristics comparable to discrete reference diodes. The absolute value of the reference is laser trimmed to +5.00 V with 0.6% maximum error. Its temperature coefficient is also laser trimmed.

Typical full-scale gain TC is 15 ppm/ $^{\circ}$ C. With guaranteed monotonicity over the full temperature range, the AD75004 is well suited for wide temperature range performance.

NOTES

¹Gain and bipolar zero errors are measured using internal voltage reference and include its errors.

²Digital crosstalk is defined as the change in any one output's steady state value as a result of any other output being driven from V_{OUTMIN} to V_{OUTMAX} into a $2 \text{ k}\Omega \parallel 500 \text{ pF}$ load by means of varying the digital input code.

³The internal voltage reference is intended to drive on-chip only; buffer it if using it externally.

⁴All minimum and maximum specifications are guaranteed, and specifications shown in **boldface** are tested on all production units at final electrical test. Results from those tests are used to calculate outgoing quality levels.

*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD75004 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
