

# LMX2330U/LMX2331U/LMX2332U PLLatinum™ Ultra Low Power Dual Frequency Synthesizer for RF Personal Communications LMX2330U 2.5 GHz/600 MHz LMX2331U 2.0 GHz/600 MHz

LMX2332U 1.2 GHz/600 MHz

## **General Description**

The LMX233xU devices are high performance frequency synthesizers with integrated dual modulus prescalers. The LMX233xU devices are designed for use as RF and IF local oscillators for dual conversion radio transceivers.

A 32/33 or a 64/65 prescale ratio can be selected for the 2.5 GHz LMX2330U RF synthesizer. A 64/65 or a 128/129 prescale ratio can be selected for both the LMX2331U and LMX2332U RF synthesizers. The IF circuitry contains an 8/9 or a 16/17 prescaler. Using a proprietary digital phase locked loop technique, the LMX233xU devices generate very stable, low noise control signals for RF and IF voltage controlled oscillators. Both the RF and IF synthesizers include a two-level programmable charge pump. The RF synthesizer has dedicated Fastlock circuitry.

Serial data is transferred to the devices via a three-wire interface (Data, LE, Clock). Supply voltages from 2.7V to 5.5V are supported. The LMX233xU family features ultra low current consumption:

LMX2330U (2.5 GHz)—3.3 mA, LMX2331U (2.0 GHz)—2.9 mA, LMX2332U (1.2 GHz)—2.5 mA at 3.0V.

The LMX233xU devices are available in 20-Pin TSSOP, 24-Pin CSP, and 20-Pin UTCSP surface mount plastic packages.

## **Features**

- Ultra Low Current Consumption
- Upgrade and Compatible to LMX233xL Family
- 2.7V to 5.5V Operation
- Selectable Synchronous or Asynchronous Powerdown Mode:

 $I_{CC-PWDN} = 1 \mu A typical$ 

■ Selectable Dual Modulus Prescaler:

LMX2330U RF: 32/33 or 64/65 LMX2331U RF: 64/65 or 128/129 LMX2332U RF: 64/65 or 128/129 LMX2330U/31U/32U IF: 8/9 or 16/17

- Selectable Charge Pump TRI-STATE® Mode
- Programmable Charge Pump Current Levels RF and IF: 0.95 or 3.8 mA
- Selectable Fastlock<sup>™</sup> Mode for the RF Synthesizer
- Push-Pull Analog Lock Detect Output
- Available in 20-Pin TSSOP, 24-Pin CSP, and 20-Pin UTCSP

# **Applications**

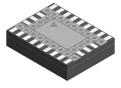

- Mobile Handsets (GSM, GPRS, W-CDMA, CDMA, PCS, AMPS, PDC, DCS)
- Cordless Handsets (DECT, DCT)
- Wireless Data
- Cable TV Tuners

# **Pin Descriptions**

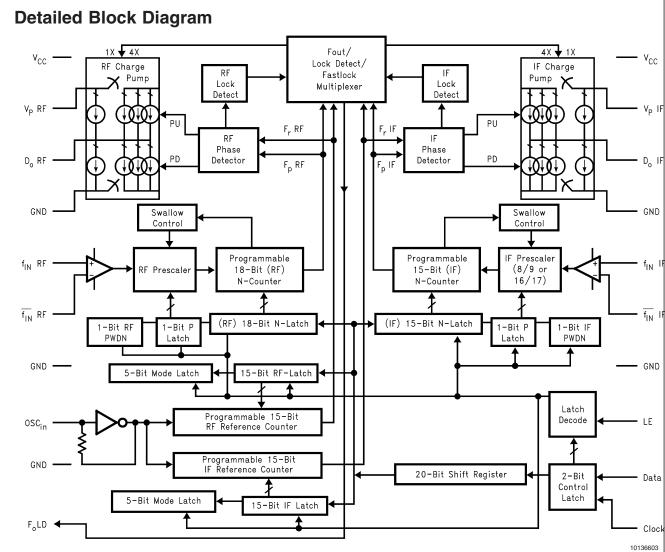

Pin Name	Pin No. 20-Pin UTCSP	Pin No. 24-Pin CSP	Pin No. 20-Pin TSSOP	I/O	Description
V <sub>CC</sub>	20	24	1		Power supply bias for the RF PLL analog and digital circuits.
					V <sub>CC</sub> may range from 2.7V to 5.5V. Bypass capacitors should be
					placed as close as possible to this pin and be connected directly
					to the ground plane.
V <sub>P</sub> RF	1	2	2	_	RF PLL charge pump power supply. Must be $\geq V_{CC}$ .
D <sub>o</sub> RF	2	3	3	0	RF PLL charge pump output. The output is connected to the
					external loop filter, which drives the input of the VCO.
GND	3	4	4	_	Ground for the RF PLL digital circuitry.
f <sub>IN</sub> RF	4	5	5	I	RF PLL prescaler input. Small signal input from the VCO.

# Pin Descriptions (Continued)

Pin	Pin No.	Pin No.	Pin No.	I/O	Description
Name	20-Pin UTCSP	24-Pin CSP	20-Pin TSSOP		·
f <sub>IN</sub> RF	5	6	6	I	RF PLL prescaler complementary input. For single ended operation, this pin should be AC grounded. The LMX233xU RF PLL can be driven differentially when the bypass capacitor is omitted.
GND	6	7	7	_	Ground for the RF PLL analog circuitry.
OSC <sub>in</sub>	7	8	8	I	Reference oscillator input. The input has an approximate $V_{\rm CC}/2$ threshold and can be driven from an external CMOS or TTL logic gate.
GND	8	10	9	_	Ground for the IF PLL digital circuits, MICROWIRE™, F <sub>o</sub> LD, and oscillator circuits.
F <sub>o</sub> LD	9	11	10	0	Programmable multiplexed output pin. Functions as a general purpose CMOS TRI-STATE output, RF/IF PLL push-pull analog lock detect output, N and R divider output or Fastlock output, which connects a parallel resistor to the external loop filter.
Clock	10	12	11	I	MICROWIRE Clock input. High impedance CMOS input. Data is clocked into the 22-bit shift register on the rising edge of Clock.
Data	11	14	12	I	MICROWIRE Data input. High impedance CMOS input. Binary serial data. The MSB of Data is shifted in first. The last two bits are the control bits.
LE	12	15	13	I	MICROWIRE Latch Enable input. High impedance CMOS input. When LE transitions HIGH, Data stored in the shift register is loaded into one of 4 internal control registers.
GND	13	16	14	_	Ground for the IF PLL analog circuitry.
f <sub>IN</sub> IF	14	17	15	I	IF PLL prescaler complementary input. For single ended operation, this pin should be AC grounded. The LMX233xU IF PLL can be driven differentially when the bypass capacitor is omitted.
f <sub>IN</sub> IF	15	18	16	ı	IF PLL prescaler input. Small signal input from the VCO.
GND	16	19	17	_	Ground for the IF PLL digital circuitry, MICROWIRE, F <sub>o</sub> LD, and oscillator circuits.
D <sub>o</sub> IF	17	20	18	0	IF PLL charge pump output. The output is connected to the external loop filter, which drives the input of the VCO.
V <sub>P</sub> IF	18	22	19	_	IF PLL charge pump power supply. Must be $\geq$ V <sub>CC</sub> .
V <sub>CC</sub>	19	23	20	_	Power supply bias for the IF PLL analog and digital circuits, MICROWIRE, F <sub>o</sub> LD, and oscillator circuits. V <sub>CC</sub> may range from 2.7V to 5.5V. Bypass capacitors should be placed as close as possible to this pin and be connected directly to the ground plane.
NC	X	1, 9, 13, 21	X	_	No connect.

### Notes:

- 1. A 64/65 or 128/129 prescaler ratio can be selected for the LMX2331U and LMX2332U RF synthesizers. A 32/33 or 64/65 prescaler ratio can be selected for the LMX2330U RF synthesizer.
- 2. V<sub>CC</sub> supplies power to the RF and IF prescalers, RF and IF feedback dividers, RF and IF reference dividers, RF and IF phase detectors, the OSC<sub>in</sub> buffer, MICROWIRE, and F<sub>0</sub>LD circuitry.
- 3.  $V_P$  RF and  $V_P$  IF supply power to the charge pumps. They can be run separately as long as  $V_P$  RF  $\geq$   $V_{CC}$  and  $V_P$  IF  $\geq$   $V_{CC}$

## **Absolute Maximum Ratings (Notes 1,**

2, 3)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/ Distributors for availability and specifications.

Power Supply Voltage

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Recommended Operating Conditions indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, refer to the Electrical Characteristics section. The guaranteed specifications apply only for the conditions listed.

**Note 2:** This device is a high performance RF integrated circuit with an ESD rating <2 kV and is ESD sensitive. Handling and assembly of this device should only be done at ESD protected work stations.

Note 3: GND = 0V

**Note 4:** Some of the values in this range are illegal divide ratios (B < A). To obtain continuous legal division, the Minimum Divide Ratio must be calculated. Use N  $\geq$  P \* (P-1), where P is the value of the prescaler selected.

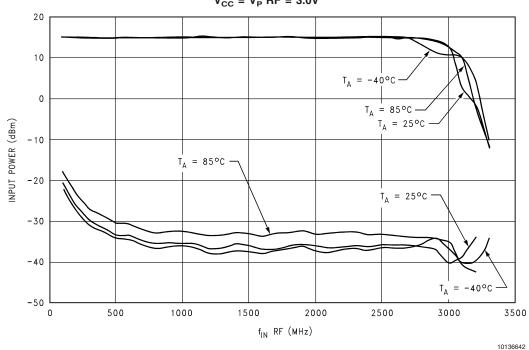

- Note 5: Refer to the LMX233xU f<sub>IN</sub> Sensitivity Test Setup section
- Note 6: Refer to the LMX233xU Charge Pump Test Setup section
- Note 7: Refer to the Charge Pump Current Specification Definitions for details on how these measurements are made.
- Note 8: Refer to the LMX233xU OSC<sub>in</sub> Sensitivity Test Setup section
- Note 9: Refer to the LMX233xU Serial Data Input Timing section

Note 10: Normalized Phase Noise Contribution is defined as :  $L_N(f) = L(f) - 20 \log (N) - 10 \log (F_{\phi})$ , where L(f) is defined as the single side band phase noise measured at an offset frequency, f, in a 1 Hz bandwidth. The offset frequency, f, must be chosen sufficiently smaller than the PLL's loop bandwidth, yet large enough to avoid substantial phase noise contribution from the reference source. N is the value selected for the feedback divider and  $F_{\phi}$  is the RF/IF phase detector comparison frequency.

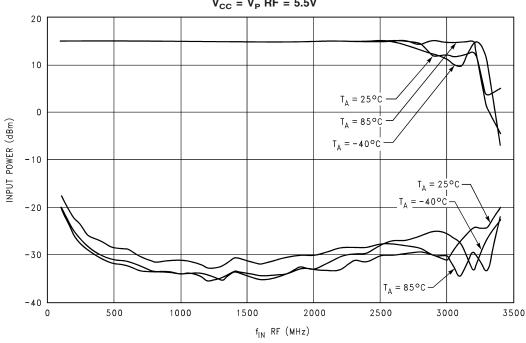

Note 11: The synthesizer phase noise is measured with the LMX2330TMEB/LMX2330SLBEB/LMX2330SLEEB Evaluation boards and the HP8566B Spectrum Analyzer.

# **Charge Pump Current Specification Definitions**

I1 = Charge Pump Sink Current at  $VD_0 = V_P - \Delta V$ 

I2 = Charge Pump Sink Current at  $VD_0 = V_P/2$ 

I3 = Charge Pump Sink Current at  $VD_0 = \Delta V$ 

I4 = Charge Pump Source Current at  $VD_0 = V_P - \Delta V$ 

I5 = Charge Pump Source Current at VD<sub>0</sub> = V<sub>P</sub>/2

I6 = Charge Pump Source Current at  $VD_0 = \Delta V$ 

 $\Delta V = Voltage$  offset from the positive and negative rails. Dependent on the VCO tuning range relative to  $V_{CC}$  and GND. Typical values are between 0.5V and 1.0V.

 $V_P$  refers to either  $V_P$  RF or  $V_P$  IF

VDo refers to either VDo RF or VDo IF

 ${\rm ID_0}$  refers to either  ${\rm ID_0}$  RF or  ${\rm ID_0}$  IF

### Charge Pump Output Current Magnitude Variation Vs Charge Pump Output Voltage

$$ID_{o} Vs VD_{o} = \frac{(|I1| - |I3|)}{(|I1| + |I3|)} \times 100\%$$
$$= \frac{(|I4| - |I6|)}{(|I4| + |I6|)} \times 100\%$$

### Charge Pump Output Sink Current Vs Charge Pump Output Source Current Mismatch

$$ID_o$$
 SINK Vs  $ID_o$  SOURCE = 
$$\frac{||2| - |15|}{\frac{1}{2}(||2| + ||5|)} \times 100\%$$

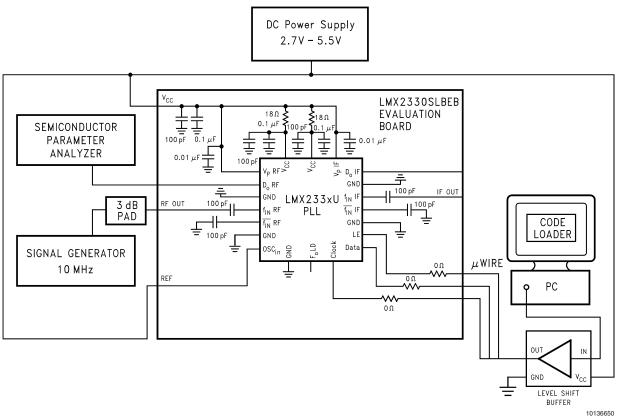

## Charge Pump Output Current Magnitude Variation Vs Temperature

$$ID_{o} \text{ Vs } T_{A} = \frac{|I_{2}||_{T_{A}} - |I_{2}||_{T_{A} = 25^{\circ}C}}{|I_{2}||_{T_{A} = 25^{\circ}C}} \times 100\%$$

$$= \frac{|I_{5}||_{T_{A}} - |I_{5}||_{T_{A} = 25^{\circ}C}}{|I_{5}||_{T_{A} = 25^{\circ}C}} \times 100\%$$

## **Test Setups**

## LMX233xU Charge Pump Test Setup

The block diagram above illustrates the setup required to measure the LMX233xU device's RF charge pump sink current. The same setup is used for the LMX2330TMEB/LMX2330SLEEB Evaluation Boards. The IF charge pump measurement setup is similar to the RF charge pump measurement setup. The purpose of this test is to assess the functionality of the RF charge pump.

This setup uses an open loop configuration. A power supply is connected to  $\rm V_{cc}$  and swept from 2.7V to 5.5V. By means of a signal generator, a 10 MHz signal is typically applied to the  $\rm f_{IN}$  RF pin. The signal is one of two inputs to the phase detector. The 3 dB pad provides a 50  $\Omega$  match between the PLL and the signal generator. The OSC in pin is tied to  $\rm V_{cc}$ . This establishes the other input to the phase detector. Alternatively, this input can be tied directly to the ground plane. With the  $\rm D_o$  RF pin connected to a Semiconductor Parameter Analyzer in this way, the sink, source, and TRI-STATE currents can be measured by simply toggling the **Phase Detector Polarity** and **Charge Pump State** states in Code Loader. Similarly, the LOW and HIGH currents can be measured

sured by switching the **Charge Pump Gain's** state between **1X** and **4X** in Code Loader.

Let  $F_r$  represent the frequency of the signal applied to the OSC<sub>in</sub> pin, which is simply zero in this case (DC), and let  $F_p$  represent the frequency of the signal applied to the  $f_{\rm IN}$  RF pin. The phase detector is sensitive to the rising edges of  $F_r$  and  $F_p$ . Assuming positive VCO characteristics; the charge pump turns ON and sinks current when the first rising edge of  $F_p$  is detected. Since  $F_r$  has no rising edge, the charge pump continues to sink current indefinitely.

Toggling the **Phase Detector Polarity** state to negative VCO characteristics allows the measurement of the RF charge pump source current. Likewise, selecting **TRI-STATE** (TRI-STATE ID $_{\rm o}$  RF Bit = 1) for **Charge Pump State** in Code Loader facilitates the measurement of the TRI-STATE current

The measurements are repeated at different temperatures, namely  $T_A = -40$  °C, +25 °C, and +85 °C.

## Test Setups (Continued)

### LMX233xU f<sub>IN</sub> Sensitivity Test Setup DC Power Supply 2.7V - 5.5V LMX2330SLBEB 10 MHz REF OUT **EVALUATION ≶**18Ω 18Ω BOARD SIGNAL GENERATOR 100 p 100 MHz - 2500 MHz D<sub>o</sub> RF 100 pF IF OUT GND LMX233xU f<sub>IN</sub> I 3 dB PAD 100 pF f<sub>IN</sub> RF f<sub>IN</sub> RF GNI CODE LOADER 100 pF GND Data osc<sub>in</sub> $\mu$ WIRE PC ₩ UNIVERSAL COUNTER LEVEL SHIFT 10136640

The block diagram above illustrates the setup required to measure the LMX233xU device's RF input sensitivity level. The same setup is used for the LMX2330TMEB/LMX2330SLEEB Evaluation Boards. The IF input sensitivity test setup is similar to the RF sensitivity test setup. The purpose of this test is to measure the acceptable signal level to the  $f_{\rm IN}$  RF input of the PLL chip. Outside the acceptable signal range, the feedback divider begins to divide incorrectly and miscount the frequency.

The setup uses an open loop configuration. A power supply is connected to  $\rm V_{cc}$  and swept from 2.7V to 5.5V. The IF PLL is powered down (PWDN IF Bit = 1). By means of a signal generator, an RF signal is applied to the  $\rm f_{IN}$  RF pin. The 3 dB pad provides a 50  $\Omega$  match between the PLL and the signal generator. The OSC in pin is tied to  $\rm V_{cc}$ . The N value is typically set to 10000 in Code Loader, i.e. RF N\_CNTRB Word = 156 and RF N\_CNTRA Word = 16 for PRE RF Bit = 1 (LMX2330U) or PRE RF = 0 (LMX2331U and LMX2332U). The feedback divider output is routed to the  $\rm F_oLD$  pin by

selecting the **RF PLL N Divider Output** word ( $F_oLD$  Word = 6 or 14) in Code Loader. A Universal Counter is connected to the  $F_oLD$  pin and tied to the 10 MHz reference output of the signal generator. The output of the feedback divider is thus monitored and should be equal to  $f_{IN}$  RF / N.

The f $_{\text{IN}}$  RF input frequency and power level are then swept with the signal generator. The measurements are repeated at different temperatures, namely  $T_{\text{A}} = -40\,^{\circ}\text{C}$ ,  $+25\,^{\circ}\text{C}$ , and  $+85\,^{\circ}\text{C}$ . Sensitivity is reached when the frequency error of the divided RF input is greater than or equal to 1 Hz. The power attenuation from the cable and the 3 dB pad must be accounted for. The feedback divider will actually miscount if too much or too little power is applied to the  $f_{\text{IN}}$  RF input. Therefore, the allowed input power level will be bounded by the upper and lower sensitivity limits. In a typical application, if the power level to the  $f_{\text{IN}}$  RF input approaches the sensitivity limits, this can introduce spurs and degradation in phase noise. When the power level gets even closer to these limits, or exceeds it, then the RF PLL loses lock.

LEVEL SHIFT

The block diagram above illustrates the setup required to measure the LMX233xU device's OSC<sub>in</sub> buffer sensitivity level. The same setup is used for the LMX2330TMEB/LMX2330SLEEB Evaluation Boards. This setup is similar to the  $f_{\rm IN}$  sensitivity setup except that the signal generator is now connected to the OSC<sub>in</sub> pin and both  $f_{\rm IN}$  pins are tied to  $V_{\rm CC}$ . The 51  $\Omega$  shunt resistor matches the OSC<sub>in</sub> input to the signal generator. The R counter is typically set to 1000, i.e. RF R\_CNTR Word = 1000 or IF R\_CNTR Word = 1000. The reference divider output is routed to the  $F_{\rm o}$ LD pin by selecting the RF PLL R Divider Output word ( $F_{\rm o}$ LD Word = 2 or 10) or the IF PLL R Divider Output word ( $F_{\rm o}$ LD Word = 1 or

9) in Code Loader. Similarly, a Universal Counter is connected to the  $F_oLD$  pin and is tied to the 10 MHz reference output from the signal generator. The output of the reference divider is monitored and should be equal to  $OSC_{in}/P$  RFR\_CNTR or  $OSC_{in}/P$  IF R\_CNTR.

Again,  $V_{CC}$  is swept from 2.7V to 5.5V. The OSC<sub>in</sub> input frequency and voltage level are then swept with the signal generator. The measurements are repeated at different temperatures, namely  $T_A = -40^{\circ}\text{C}$ ,  $+25^{\circ}\text{C}$ , and  $+85^{\circ}\text{C}$ . Sensitivity is reached when the frequency error of the divided input signal is greater than or equal to 1 Hz.

## Test Setups (Continued)

### LMX233xU f<sub>IN</sub> Impedance Test Setup DC Power Supply 2.7V - 5.5VLMX2330SLBEB **EVALUATION ≨**18Ω 18.Ω BOARD 궆 100 pF D<sub>o</sub> IF D<sub>o</sub> RF IF OUT GND LMX233xU f<sub>IN</sub> IF RF OUT 100 pF f<sub>IN</sub> RF NETWORK ANALYZER PLL $\overline{f_{\text{IN}}}$ RF GND CODE LOADER 100 pF LE GND Data OSC<sub>in</sub> μWIRE PC ₹51Ω LEVEL SHIFT BUFFFR

The block diagram above illustrates the setup required to measure the LMX233xU device's RF input impedance. The IF input impedance and reference oscillator impedance setups are very much similar. The same setup is used for the LMX2330TMEB/ LMX2330SLEEB Evaluation Boards. Measuring the device's input impedance facilitates the design of appropriate matching networks to match the PLL to the VCO, or in more critical situations, to the characteristic impedance of the printed circuit board (PCB) trace, to prevent undesired transmission line effects.

Before the actual measurements are taken, the Network Analyzer needs to be calibrated, i.e. the error coefficients need to be calculated. Therefore, three standards will be used to calculate these coefficients: an **open**, **short** and a **matched load**. A 1-port calibration is implemented here.

To calculate the coefficients, the PLL chip is first removed from the PCB. The Network Analyzer port is then connected to the RF OUT connector of the evaluation board and the desired operating frequency is set. The typical frequency range selected for the LMX233xU device's RF synthesizer is from 100 MHz to 2500 MHz. The standards will be located down the length of the RF OUT transmission line. The transmission line adds electrical length and acts as an offset from the reference plane of the Network Analyzer; therefore, it

must be included in the calibration. Although not shown, 0  $\Omega$  resistors are used to complete the RF OUT transmission line (trace).

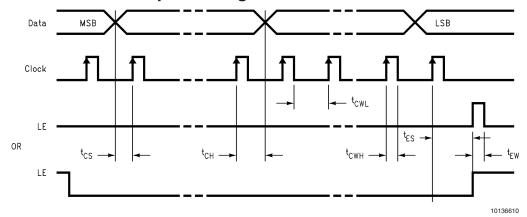

10136679

To implement an **open** standard, the end of the RF OUT trace is simply left open. To implement a **short** standard, a 0  $\Omega$  resistor is placed at the end of the RF OUT transmission line. Last of all, to implement a **matched load** standard, two 100  $\Omega$  resistors in parallel are placed at the end of the RF OUT transmission line. The Network Analyzer calculates the calibration coefficients based on the measured S<sub>11</sub> parameters. With this all done, calibration is now complete.

The PLL chip is then placed on the PCB. A power supply is connected to  $V_{\rm CC}$  and swept from 2.7V to 5.5V. The  $OSC_{\rm in}$  pin is tied to the ground plane. Alternatively, the  $OSC_{\rm in}$  pin can be tied to  $V_{\rm CC}$ . In this setup, the complementary input  $(\overline{f}_{\rm IN}$  RF) is AC coupled to ground. With the Network Analyzer still connected to RF OUT, the measured  $f_{\rm IN}$  RF impedance is displayed.

**Note:** The impedance of the reference oscillator is measured when the oscillator buffer is powered up (PWDN RF Bit = 0  $\sigma$  PWDN IF Bit = 0), and when the oscillator buffer is powered down (PWDN RF Bit = 1  $\sigma$  and PWDN IF Bit = 1).

# LMX233xU Serial Data Input Timing

### Notes:

- 1. Data is clocked into the 22-bit shift register on the rising edge of Clock
- 2. The MSB of Data is shifted in first.

# 1.0 Functional Description

The basic phase-lock-loop (PLL) configuration consists of a high-stability crystal reference oscillator, a frequency synthesizer such as the National Semiconductor LMX233xU, a voltage controlled oscillator (VCO), and a passive loop filter. The frequency synthesizer includes a phase detector, current mode charge pump, programmable reference R and feedback N frequency dividers. The VCO frequency is established by dividing the crystal reference signal down via the reference divider to obtain a comparison reference frequency. This reference signal, F<sub>r</sub>, is then presented to the input of a phase/frequency detector and compared with the feedback signal,  $F_p$ , which was obtained by dividing the VCO frequency down by way of the feedback divider. The phase/ frequency detector measures the phase error between the F<sub>r</sub> and F<sub>p</sub> signals and outputs control signals that are directly proportional to the phase error. The charge pump then pumps charge into or out of the loop filter based on the magnitude and direction of the phase error. The loop filter converts the charge into a stable control voltage for the VCO. The phase/frequency detector's function is to adjust the voltage presented to the VCO until the feedback signal's frequency and phase match that of the reference signal. When this "Phase-Locked" condition exists, the VCO frequency will be N times that of the comparison frequency, where N is the feedback divider ratio.

#### 1.1 REFERENCE OSCILLATOR INPUT

The reference oscillator frequency for both the RF and IF PLLs is provided from an external reference via the OSC $_{\rm in}$  pin. The reference buffer circuit supports input frequencies from 5 to 40 MHz with a minimum input sensitivity of 0.5 V $_{\rm PP}$ . The reference buffer circuit has an approximate V $_{\rm CC}/2$  input threshold and can be driven from an external CMOS or TTL logic gate. Typically, the OSC $_{\rm in}$  pin is connected to the output of a crystal oscillator.

### 1.2 REFERENCE DIVIDERS (R COUNTERS)

The reference dividers divide the reference input signal, OSC<sub>in</sub>, by a factor of R. The output of the reference divider circuits feeds the reference input of the phase detector. This reference input to the phase detector is often referred to as the comparison frequency. The divide ratio should be chosen such that the maximum phase comparison frequency ( $F_{\phi RF}$  or  $F_{\phi IF}$ ) of 10 MHz is not exceeded.

The RF and IF reference dividers are each comprised of 15-bit CMOS binary counters that support a continuous integer divide ratio from 3 to 32767. The RF and IF reference divider circuits are clocked by the output of the reference buffer circuit which is common to both.

#### 1.3 PRESCALERS

The  $f_{\text{IN}}$  RF ( $f_{\text{IN}}$  IF) and  $\overline{f_{\text{IN}}}$  RF ( $\overline{f_{\text{IN}}}$  IF) input pins drive the input of a bipolar, differential-pair amplifier. The output of the bipolar, differential-pair amplifier drives a chain of ECL D-type flip-flops in a dual modulus configuration. The output of the prescaler is used to clock the subsequent feedback dividers. The RF and IF PLL complementary inputs can be driven differentially, or the negative input can be AC coupled to ground through an external capacitor for single ended configuration. A 32/33 or a 64/65 prescale ratio can be selected for the 2.5 GHz LMX2330U RF synthesizer. A 64/65 or a 128/129 prescale ratio can be selected for both the

LMX2331U and LMX2332U RF synthesizers. The IF circuitry contains an 8/9 or a 16/17 prescaler.

# 1.4 PROGRAMMABLE FEEDBACK DIVIDERS (N COUNTERS)

The programmable feedback dividers operate in concert with the prescalers to divide the input signal,  $f_{\rm IN}$ , by a factor of N. The output of the programmable reference divider is provided to the feedback input of the phase detector circuit. The divide ratio should be chosen such that the maximum phase comparison frequency ( $F_{\varphi RF}$  or  $F_{\varphi IF}$ ) of 10 MHz is not exceeded

The programmable feedback divider circuit is comprised of an A counter (swallow counter) and a B counter (programmble binary counter). The RF N\_CNTRA counter is a 7-bit CMOS swallow counter, programmable from 0 to 127. The IF N\_CNTRA counter is also a 7-bit CMOS swallow counter, but programmable from 0 to 15. The three most significant bits are 'don't cares' in this case. The RF N CNTRB and IF N\_CNTRB counters are both 11-bit CMOS binary counters, programmable from 3 to 2047. A continuous integer divide ratio is achieved if  $N \ge P * (P-1)$ , where P is the value of the prescaler selected. Divide ratios less than the minimum continuous divide ratio are achievable as long as the binary programmable counter value is greater than the swallow counter value (N\_CNTRB ≥ N\_CNTRA). Refer to **Sections** 2.5.1, 2.5.2, 2.7.1 and 2.7.2 for details on how to program the N\_CNTRA and N\_CNTRB counters. The following equations are useful in determining and programming a particular value of N:

 $N = (P \times N\_CNTRB) + N\_CNTRA$   $f_{IN} = N \times F_{\Phi}$ 

### Definitions:

 $F_{\phi}$ : RF or IF phase detector comparison

frequency

f<sub>IN</sub>: RF or IF input frequency N\_CNTRA: RF or IF A counter value N\_CNTRB: RF or IF B counter value

P: Preset modulus of the dual modulus

prescaler

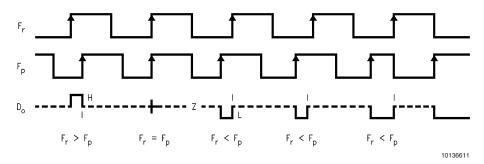

LMX2330U RF synthesizer: P = 32 or 64 LMX2331U RF synthesizer: P = 64 or 128 LMX2332U RF synthesizer: P = 64 or 128 LMX233xU IF synthesizer: P = 8 or 16

#### 1.5 PHASE/FREQUENCY DETECTORS

The RF and IF phase/frequency detectors are driven from their respective N and R counter outputs. The maximum frequency for both the RF and IF phase detector inputs is 10 MHz. The phase/frequency detector outputs control the respective charge pumps. The polarity of the pump-up or pump-down control signals are programmed using the **PD\_POL RF** or **PD\_POL IF** control bits, depending on whether the RF or IF VCO characteristics are positive or negative. Refer to **Sections 2.4.2** and **2.6.2** for more details. The phase/frequency detectors have a detection range of  $-2\pi$  to  $+2\pi$ . The phase/frequency detectors also receive a feedback signal from the charge pump in order to eliminate dead zone.

# 1.0 Functional Description (Continued)

PHASE COMPARATOR AND INTERNAL CHARGE PUMP CHARACTERISTICS

#### Notes:

- 1. The minimum width of the pump-up and pump-down current pulses occur at the Do RF or Do IF pins when the loop is phase locked.
- 2. The diagram assumes positive VCO characteristics, i.e. PD\_POL RF or PD\_POL IF = 1.
- 3. Fr is the phase detector input from the reference divider (R counter).
- 4. F<sub>p</sub> is the phase detector input from the programmable feedback divder (N counter).
- 5. Do refers to either the RF or IF charge pump output.

#### 1.6 CHARGE PUMPS

The charge pump directs charge into or out of an external loop filter. The loop filter converts the charge into a stable control voltage which is applied to the tuning input of the VCO. The charge pump steers the VCO control voltage towards  $\rm V_P$  RF or  $\rm V_P$  IF during pump-up events and towards GND during pump-down events. When locked,  $\rm D_o$  RF or  $\rm D_o$  IF are primarily in a TRI-STATE mode with small corrections occuring at the phase comparator rate. The charge pump output current magnitude can be selected by toggling the  $\rm ID_o$  RF or  $\rm ID_o$  IF control bits.

#### 1.7 MICROWIRE SERIAL INTERFACE

The programmable register set is accessed via the MI-CROWIRE serial interface. The interface is comprised of three signal pins: Clock, Data and LE (Latch Enable). Serial data is clocked into the 22-bit shift register on the rising edge of Clock. The last two bits decode the internal control register address. When LE transitions HIGH, data stored in the shift register is loaded into one of four control registers depending on the state of the address bits. The MSB of Data is loaded in first. The synthesizers can be programmed even in power down mode. A complete programming description is provided in Section 2.0 Programming Description.

#### 1.8 MULTI-FUNCTION OUTPUTS

The LMX233xU device's  $F_oLD$  output pin is a multi-function output that can be configured as the RF FastLock output, a push-pull analog lock detect output, counter reset, or used to monitor the output of the various reference divider (R counter) or feedback divider (N counter) circuits. The  $F_oLD$  control word is used to select the desired output function. When the PLL is in powerdown mode, the  $F_oLD$  output is pulled to a LOW state. A complete programming description of the multi-function output is provided in **Section 2.8**  $F_oLD$ .

### 1.8.1 Push-Pull Analog Lock Detect Output

An analog lock detect status generated from the phase detector is available on the  $F_oLD$  output pin if selected. The lock detect output goes HIGH when the charge pump is inactive. It goes LOW when the charge pump is active during a comparison cycle. When viewed with an oscilloscope, narrow negative pulses are observed when the charge pump turns on. The lock detect output signal is a push-pull configuration.

Three separate lock detect signals are routed to the multiplexer. Two of these monitor the 'lock' status of the individual synthesizers. The third detects the condition when both the RF and IF synthesizers are in a 'locked state'. External circuitry however, is required to provide a steady DC signal to indicate when the PLL is in a locked state. Refer to **Section 2.8 F<sub>o</sub>LD** for details on how to program the different lock detect options.

# 1.0 Functional Description (Continued)

#### 1.8.2 Open Drain FastLock Output

The LMX233xU Fastlock feature allows faster loop response time during lock aquisition. The loop response time (lock time) can be approximately halved if the loop bandwidth is doubled. In order to achieve this, the same gain/ phase relationship at twice the loop bandwidth must be maintained. This can be achieved by increasing the charge pump current from 0.95 mA (ID, RF Bit = 0) in the steady state mode, to 3.8 mA (ID  $_{\circ}$  RF Bit = 1) in Fastlock. When the F $_{\circ}$ LD output is configured as a FastLock output, an open drain device is enabled. The open drain device switches in a parallel resistor R2' to ground, of equal value to resistor R2 of the external loop filter. The loop bandwidth is effectively doubled and stability is maintained. Once locked to the correct frequency, the PLL will return to a steady state condition. Refer to Section 2.8 FoLD for details on how to configure the FoLD output to an open drain Fastlock output.

#### 1.8.3 Counter Reset

Three separate counter reset functions are provided. When the F<sub>o</sub>LD is programmed to **Reset IF Counters**, both the IF feedback divider and the IF reference divider are held at their load point. When the **Reset RF Counters** is programmed, both the RF feedback divider and the RF reference divider are held at their load point. When the **Reset All Counters** mode is enabled, all feedback dividers and reference dividers are held at their load point. When the device is programmed to normal operation, both the feedback divider and reference divider are enabled and resume counting in 'close' alignment to each other. Refer to **Section 2.8 F<sub>o</sub>LD** for more details.

# 1.8.4 Reference Divider and Feedback Divider Output

The outputs of the various N and R dividers can be monitored by selecting the appropriate  $F_oLD$  word. This is essential when performing  $OSC_{in}$  or  $f_{iN}$  sensitivity measurements. Refer to the **Test Setups** section for more details. Refer to **Section 2.8**  $F_oLD$  for more details on how to route the appropriate divider output to the  $F_oLD$  pin.

#### 1.9 POWER CONTROL

Each synthesizer in the LMX233xU device is individually power controlled by device powerdown bits. The powerdown word is comprised of the PWDN RF (PWDN IF) bit, in conjuction with the TRI-STATE ID<sub>o</sub> RF (TRI-STATE ID<sub>o</sub> IF) bit. The powerdown control word is used to set the operating mode of the device. Refer to Sections 2.4.4, 2.5.4, 2.6.4, and 2.7.4 for details on how to program the RF or IF powerdown bits.

When either the RF synthesizer or the IF synthesizer enters the powerdown mode, the respective prescaler, phase detector, and charge pump circuit are disabled. The Do RF (Do IF),  $f_{IN}$  RF ( $f_{IN}$  IF), and  $\overline{f_{IN}}$  RF ( $\overline{f_{IN}}$  IF) pins are all forced to a high impedance state. The reference divider and feedback divider circuits are held at the load point during powerdown. The oscillator buffer is disabled when both the RF and IF synthesizers are powered down. The OSC in pin is forced to a HIGH state through an approximate 100 k $\Omega$  resistance when this condition exists. When either synthesizer is activated, the respective prescaler, phase detector, charge pump circuit, and the oscillator buffer are all powered up. The feedback divider, and the reference divider are held at load point. This allows the reference oscillator, feedback divider, reference divider and prescaler circuitry to reach proper bias levels. After a finite delay, the feedback and reference dividers are enabled and they resume counting in 'close' alignment (the maximum error is one prescaler cycle). The MICROWIRE control register remains active and capable of loading and latching data while in the powerdown mode.

### Synchronous Powerdown Mode

In this mode, the powerdown function is gated by the charge pump. When the device is configured for synchronous powerdown, the device will enter the powerdown mode upon completion of the next charge pump pulse event.

#### **Asynchronous Powerdown Mode**

In this mode, the powerdown function is NOT gated by the completion of a charge pump pulse event. When the device is configured for asynchronous powerdown, the part will go into powerdown mode immediately.

TRI-STATE ID <sub>o</sub>	PWDN	Operating Mode
0	0	PLL Active, Normal Operation
1	0	PLL Active, Charge Pump Output in High Impedance State
0	1	Synchronous Powerdown
1	1	Asynchronous Powerdown

#### Notes:

- 1. TRI-STATE  ${\rm ID_o}$  refers to either the TRI-STATE  ${\rm ID_o}$  RF or TRI-STATE  ${\rm ID_o}$  IF bit .
- 2. PWDN refers to either the PWDN RF or PWDN IF bit.

# 2.0 Programming Description

# 2.1 MICROWIRE INTERFACE

The 22-bit shift register is loaded via the MICROWIRE interface. The shift register consists of a 20-bit *Data[19:0] Field* and a 2-bit *Address[1:0] Field* as shown below. The Address Field is used to decode the internal control register address. When LE transitions HIGH, data stored in the shift register is loaded into one of 4 control registers depending on the state of the address bits. The MSB of Data is loaded in first. The Data Field assignments are shown in **Section 2.3 CONTROL REGISTER CONTENT MAP**.

MSB	LSB
Data[19:0]	Address[1:0]
21 2	1 0

#### 2.2 CONTROL REGISTER LOCATION

The address bits Address[1:0] decode the internal register address. The table below shows how the address bits are mapped into the target control register.

Addre	ss[1:0]	Target
Fie	eld	Register
0	0	IF R
0	1	IF N
1	0	RF R
1	1	RF N

#### 2.3 CONTROL REGISTER CONTENT MAP

The control register content map describes how the bits within each control register are allocated to specific control functions.

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

### **BANNED SUBSTANCE COMPLIANCE**

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
