

## DS36C279

# Low Power EIA-RS-485 Transceiver with Sleep Mode

### General Description

The DS36C279 is a low power differential bus/line transceiver designed to meet the requirements of RS-485 Standard for multipoint data transmission. In addition it is compatible with TIA/EIA-422-B.

The sleep mode feature automatically puts the device in a power saving mode when both the driver and receiver are disabled.†† The device is ideal for use in power conscious applications where the device may be disabled for extended periods of time.

The driver and receiver outputs feature TRI-STATE® capability. The driver outputs operate over the entire common mode range of  $-7V$  to  $+12V$ . Bus contention or fault situations that cause excessive power dissipation within the device are handled by a thermal shutdown circuit, which forces the driver outputs into a high impedance state.

The receiver incorporates a fail safe circuit which guarantees a high output state when the inputs are left open.†

The DS36C279T is fully specified over the industrial temperature range ( $-40^{\circ}C$  to  $+85^{\circ}C$ ).

### Features

- 100% RS-485 compliant
  - Guaranteed RS-485 device interoperation
- Low power CMOS design:  $I_{CC}$  500  $\mu A$  max
- Automatic sensing sleep mode
  - Reduces  $I_{CC}$  to 10  $\mu A$  maximum
- Built-in power up/down glitch-free circuitry
  - Permits live transceiver intersection/displacement
- SOIC packages
- Industrial temperature range:  $-40^{\circ}C$  to  $+85^{\circ}C$
- On-board thermal shutdown circuitry
  - Prevents damage to the device in the event of excessive power dissipation
- Wide common mode range:  $-7V$  to  $+12V$
- Receive open input fail-safe (Note 1)
- $1/4$  unit load (DS36C279):  $\geq 128$  nodes
- $1/2$  unit load (DS36C279T):  $\geq 64$  nodes
- ESD (Human Body Model):  $\geq 2$  kV
- Drop-in replacement for:
  - LTC485 MAX485 DS75176 DS3695

**Note 3:** "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" specifies conditions of device operation.

**Note 4:** Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except  $V_{OD1}$  and  $V_{OD2}$ .

**Note 5:** All typicals are given for:  $V_{CC} = +5.0V$ ,  $T_A = +25^\circ C$ .

**Note 6:** Delta  $|V_{OD2}|$  and Delta  $|V_{OC}|$  are changes in magnitude of  $V_{OD2}$  and  $V_{OC}$ , respectively, that occur when input changes state.

**Note 7:** Threshold parameter limits specified as an algebraic value rather than by magnitude.

**Note 8:** Hysteresis defined as  $V_{HST} = V_{TH} - V_{TL}$ .

**Note 9:**  $I_{IN}$  includes the receiver input current and driver TRI-STATE leakage current.

**Note 10:**  $C_L$  includes probe and jig capacitance.

**Note 11:** For enable from sleep mode delays  $DE = L$  and  $RE^* = H$  for greater than 600 ns prior to test (device is in sleep mode).

**Note 12:** For complete details of test, see RS-485.

TABLE 1. Device Pin Descriptions

Pin No.	Name	Description
1	RO	Receiver Output: When RE (Receiver Enable) is LOW, the receiver is enabled (ON), if DO/RI $\geq$ DO*/RI* by 200 mV, RO will be HIGH. If DO/RI $\leq$ DO*/RI* by 200 mV, RO will be LOW. Additionally RO will be HIGH for OPEN (Non-terminated) Inputs.
2	RE*	Receiver Output Enable: When RE* is LOW the receiver output is enabled. When RE* is HIGH, the receiver output is in TRI-STATE (OFF). When RE* is HIGH and DE is LOW, the device will enter a low-current sleep mode after 600 ns.
3	DE	Driver Output Enable: When DE is HIGH, the driver outputs are enabled. When DE is LOW, the driver outputs are in TRI-STATE (OFF). When RE* is HIGH and DE is LOW, the device will enter a low-current sleep mode after 600 ns.
4	DI	Driver Input: When DE (Driver Enable) is HIGH, the driver is enabled, if DI is LOW, then DO/RI will be LOW and DO*/RI* will be HIGH. If DI is HIGH, then DO/RI is HIGH and DO*/RI* is LOW.
5	GND	Ground Connection.
6	DO/RI	Driver Output/Receiver Input, 485 Bus Pin.
7	DO*/RI*	Driver Output/Receiver Input, 485 Bus Pin.
8	V <sub>CC</sub>	Positive Power Supply Connection: Recommended operating range for V <sub>CC</sub> is +4.75V to +5.25V.

## Unit Load

A unit load for an RS-485 receiver is defined by the input current versus the input voltage curve. The gray shaded region is the defined operating range from  $-7\text{V}$  to  $+12\text{V}$ . The top border extending from  $-3\text{V}$  at  $0\text{ mA}$  to  $+12\text{V}$  at  $+1\text{ mA}$  is defined as one unit load. Likewise, the bottom border extending from  $+5\text{V}$  at  $0\text{ mA}$  to  $-7\text{V}$  at  $-0.8\text{ mA}$  is also defined as one unit load (see *Figure 19*). An RS-485 driver is capable of driving up to 32 unit loads. This allows up to 32 nodes on a single bus. Although sufficient for many applications, it is sometimes desirable to have even more nodes. For example, an aircraft that has 32 rows with 4 seats per row would benefit from having 128 nodes on one bus. This would allow signals to be transferred to and from each individual seat to 1 main station. Usually there is one or two less seats in the last row of the aircraft near the restrooms and food storage area. This frees the node for the main station.

The DS36C278, the DS36C279, and the DS36C280 all have  $\frac{1}{2}$  unit load and  $\frac{1}{4}$  unit load (UL) options available. These devices will allow up to 64 nodes or 128 nodes guaranteed over temperature depending upon which option is selected. The  $\frac{1}{2}$  UL option is available in industrial temperature and the  $\frac{1}{4}$  UL is available in commercial temperature.

First, for a  $\frac{1}{2}$  UL device the top and bottom borders shown in *Figure 19* are scaled. Both  $0\text{ mA}$  reference points at  $+5\text{V}$  and  $-3\text{V}$  stay the same. The other reference points are  $+12\text{V}$  at  $+0.5\text{ mA}$  for the top border and  $-7\text{V}$  at  $-0.4\text{ mA}$  for the bottom border (see *Figure 19*). Second, for a  $\frac{1}{4}$  UL device the top and bottom borders shown in *Figure 19* are scaled also. Again, both  $0\text{ mA}$  reference points at  $+5\text{V}$  and  $-3\text{V}$  stay the same. The other reference points are  $+12\text{V}$  at  $+0.25\text{ mA}$  for the top border and  $-7\text{V}$  at  $-0.2\text{ mA}$  for the bottom border (see *Figure 19*).

The advantage of the  $\frac{1}{2}$  UL and  $\frac{1}{4}$  UL devices is the increased number of nodes on one bus. In a single master multi-slave type of application where the number of slaves exceeds 32, the DS36C278/279/280 may save in the cost of extra devices like repeaters, extra media like cable, and/or extra components like resistors.

01205320

**FIGURE 19. Input Current vs Input Voltage Operating Range**

The DS36C279 and DS36C280 have an additional feature which offers more advantages. The DS36C279 has an automatic sleep mode function for power conscious applications. The DS36C280 has a slew rate control for EMI conscious applications. Refer to the sleep mode and slew rate control portion of the application information section in the corresponding datasheet for more information on these features.

## Sleep Mode

The DS36C279 features an automatic shutdown mode that allows the device to save power when not transmitting data. Since the shutdown mode is automatic, no external components are required. It may be used as little or as much as the application requires. The more the feature is utilized, the more power it saves.

The sleep mode is automatically entered when both the driver and receiver are disabled. This occurs when both the DE pin is asserted to a logic low and the RE\* pin is asserted to a logic high. Once both pins are asserted the device will enter sleep mode typically in  $50\text{ ns}$ . The DS36C279 is guaranteed to go into sleep mode within  $600\text{ ns}$  after both pins are asserted. The device wakes up (comes out of sleep mode) when either the DE pin is asserted to a logic high and/or the RE\* pin is asserted to a logic low. After the device enters sleep mode it will take longer for the device to wake up than it does for the device to enable from TRI-STATE. Refer to datasheet specifications  $t_{PSL}$  and  $t_{PSH}$  and compare with  $t_{PZL}$  and  $t_{PZH}$  for timing differences.

The benefit of the DS36C279 is definitely its power savings. When active the device has a maximum  $I_{CC}$  of  $500\text{ }\mu\text{A}$ . When in sleep mode the device has a maximum  $I_{CC}$  of only  $10\text{ }\mu\text{A}$ , which is 50 times less power than when active. The  $I_{CC}$  when the device is active is already very low but when in sleep mode the  $I_{CC}$  is ultra low.

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

### BANNED SUBSTANCE COMPLIANCE

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
