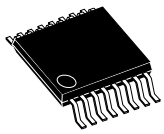
STLVDS3486

High speed differential line drivers

Feature summary

- meets or exceeds the requirements of ansi TIA/EIA-644 standard
- Operates with a single 3.3V supply
- Designed for signaling rate up to 400Mbps
- Differential input thresholds ±100mV max
- Typical propagation delay time of 2.5ns
- Power dissipation 60mW typical per receiver at 200MHz
- Low voltage TTL (LVTTL) logic output levels
- Pin compatible with the MC3486 and SN65LVD3486
- Open circuit fail safe
- ESD protection:
  7KV receiver pins
  3KV all pins vs gnd



TSSOP

Description

The STLVDS3486, is a differential line receiver that implements the electrical characteristics of low voltage differential signaling (LVDS). This signaling technique lowers the output voltage levels of 5V differential standard levels (such as TIA/EIA-422B) to reduce the power, increase the switching speeds and allow operations with a 3.3V supply rail. This differential receiver provides a valid logical output state with a 3.3V supply rail. It also provides a valid logical output state with a ±100mV differential input voltage within the input common mode voltage range. The input common mode voltage allows 1V of ground potential difference between two LVDS nodes.

The intended application of this device and signaling technique is both point-to-point and multidrop data transmission over controlled impedance media approximately 100Ω. The transmission media may be printed circuit board traces, backplanes or cables. The ultimate rate and distance of data transfer depend upon the attenuation characteristics of the media and noise coupling to the environment.

The STLVDS3486 version is characterized for operation from -40°C to 85°C.

$t_{sk(P)}$	Pulse Skew ($\|t_{PHL} - t_{PLH}\|$) (note2)			0.2	0.4	ns
$t_{sk(PP)}$	Part to Part Skew (note3)				1	ns
t_{PZH}	Propagation Delay Time, High Impedance to High Level Output	Fig. 2		3	12	ns
t_{PZL}	Propagation Delay Time, High Impedance to Low Level Output			5	12	ns
t_{PHZ}	Propagation Delay Time, High Level to High Impedance Output			5	12	ns
t_{PLZ}	Propagation Delay Time, Low Level to High Impedance Output			5	12	ns

Note: 1 $t_{sk(O)}$ is the maximum delay time difference between the propagation delay of one channel and that of the others on the same chip with any event on the inputs.

2 $t_{sk(P)}$ is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

3 $t_{sk(PP)}$ is the differential channel-to-channel skew of any event between devices. This specification applies to devices at the same V_{CC}, and within 5°C of each other within the operating temperature range.

7 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
