

SIM/Smart Card Level Translators in μ MAX

MAX1740/MAX1741

General Description

The MAX1740/MAX1741 subscriber identity module (SIM)/smart card level translators provide level shifting and electrostatic discharge (ESD) protection for SIM and smart card ports. These devices integrate two unidirectional level shifters for the reset and clock signals, a bidirectional level shifter for the serial data stream, and $\pm 10\text{kV}$ ESD protection on all card contacts.

The MAX1740 includes a $\overline{\text{SHDN}}$ control input to aid insertion and removal of SIM and smart cards, while the MAX1741 includes a system-side data driver to support system controllers without open-drain outputs. The logic supply voltage range is +1.425V to +5.5V for the "controller side" and +2.25V to +5.5V for the "card side." Total supply current is 2.5 μA max. Both devices automatically shut down when either power supply is removed. For a complete SIM-card interface, combine the MAX1740/MAX1741 with the MAX1686H 0V/3V/5V regulated charge pump.

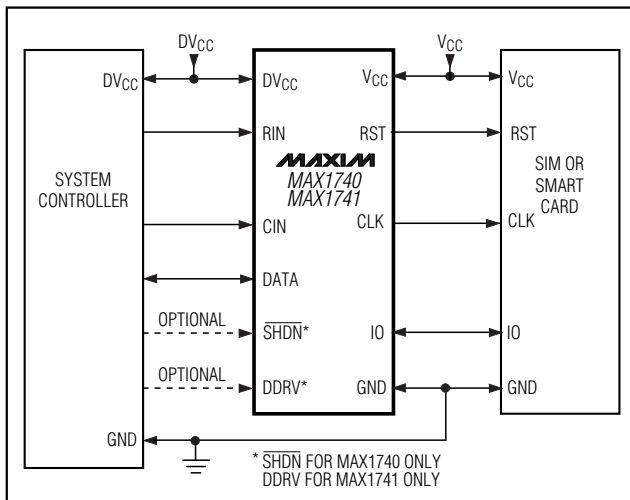

The MAX1740/MAX1741 are available in ultra-small 10-pin μ MAX packages that are only 1.09mm high and half the area of an 8-pin SO.

The MAX1740/MAX1741 are compliant with GSM test specifications 11.11 and 11.12.

Applications

- SIM Interface in GSM Cellular Telephones
- Smart Card Readers
- Logic Level Translation
- SPI™/QSPI™/MICROWIRE™ Level Translation

Typical Operating Circuit

Features

- ◆ SIM/Smart Card Level Shifting
- ◆ $\pm 10\text{kV}$ ESD Card Socket Protection
- ◆ Allows Level Translation with $DV_{CC} \geq V_{CC}$ or $DV_{CC} \leq V_{CC}$
- ◆ Automatically Shuts Down When Either Supply Is Removed
- ◆ Card Contacts Actively Pulled Low During Shutdown
- ◆ +1.425V to +5.5V Controller Voltage Range
- ◆ +2.25V to +5.5V Card Voltage Range
- ◆ 2.5 μA (max) Total Quiescent Supply Current
- ◆ 0.01 μA Total Shutdown Supply Current
- ◆ Ultra-Small 10-Pin μ MAX Package
- ◆ Compliant with GSM Test Specifications 11.11 and 11.12

SIM/Smart Card Level Translators in μ MAX

Pin Description

MAX1740/MAX1741

PIN		NAME	FUNCTION
MAX1740	MAX1741		
1	1	DATA	System Controller Data Input/Output. An open-drain input/output with a 20k Ω pull-up resistor to DV _{CC} . For bidirectional data transfer, connect to an open-drain controller output capable of sinking 1mA while pulling DATA low. If the controller is not open drain, use DDRV to send data and DATA to receive data.
2	2	DV _{CC}	Supply Voltage for System Controller Digital Pins. Set at +1.425V to +5.5V.
3	3	CIN	System Controller Clock Input
4	4	RIN	System Controller Reset Input
—	5	DDRV	Optional System Controller Data Input. Connect to controllers without an open-drain output. When not used, connect DDRV to DV _{CC} .
5	—	$\overline{\text{SHDN}}$	Shutdown Mode Input. Driving $\overline{\text{SHDN}}$ low reduces the total supply current to less than 2 μ A. In shutdown mode, RST, CLK, and IO are actively pulled low and the transfer gate between DATA and IO is disabled. When not used, connect $\overline{\text{SHDN}}$ to DV _{CC} .
6	6	GND	System Controller and Card Ground
7	7	RST	Reset Output to Card. Actively pulled low during shutdown.
8	8	CLK	Clock Output to Card. Actively pulled low during shutdown.
9	9	V _{CC}	Supply Voltage for Card-Side Digital Pins. Set at +2.25V to +5.5V. Proper supply bypassing is required to meet \pm 10kV ESD specifications.
10	10	IO	Card-Side Bidirectional Input/Output. An open-drain output with a 10k Ω pull-up resistor to V _{CC} . For bidirectional data transfer, connect to an open-drain card output capable of sinking 1mA while pulling IO low. Actively pulled low during shutdown.

Detailed Description

The MAX1740/MAX1741 provide the necessary level translation for interfacing with subscriber identity modules (SIMs) and smart cards in multivoltage systems. These devices operate with logic supply voltages between +1.425V and +5.5V on the controller side (DV_{CC}) and between +2.25V and +5.5V on the card side (V_{CC}). The total supply current (I_{DVCC} + I_{VCC}) is 2.5 μ A (max) while operating in an idle state (see *Electrical Characteristics*). Figure 2 shows a typical application circuit and functional diagram.

Level Translation

The MAX1740/MAX1741 provide level translators for a clock input, a reset input, and a bidirectional data input/output. The clock and reset inputs (CIN and RIN) are level shifted from the controller-side supply rails (DV_{CC} to GND) to the card-side supply rails (V_{CC} to GND). When connected to an open-drain controller output, DATA and IO provide bidirectional level translation.

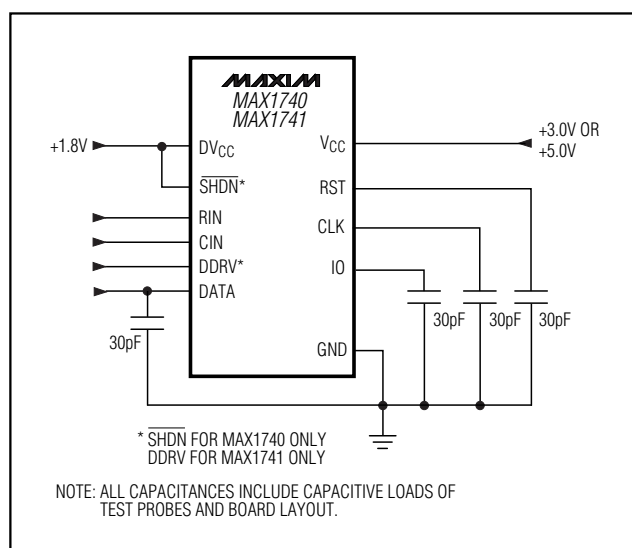

Figure 1. MAX1740/MAX1741 Test Circuit

SIM/Smart Card Level Translators in μ MAX

All level translation is valid for $DV_{CC} \geq V_{CC}$ or $DV_{CC} \leq V_{CC}$. The MAX1740/MAX1741 contain internal pull-up resistors from DATA to the controller-side supply (DV_{CC}) and from IO to the card-side supply (V_{CC}). For push-pull controller outputs, see the *Data Driver* section for bidirectional data translation.

Data Driver (MAX1741 only)

When using a microcontroller (μ C) without an open-drain output, use the data driver (DDRV) input to send data to the SIM/smart card, while DATA provides the controller-side output for bidirectional data transfer. When not used, connect DDRV to DV_{CC} to reduce total supply current.

Shutdown Mode

For the MAX1740, drive \overline{SHDN} low to activate shutdown. Connect \overline{SHDN} to DV_{CC} or drive high for normal operation. To allow for card insertion and removal, shutdown mode actively pulls CLK, RST, and IO low; it also disconnects the internal $10k\Omega$ pull-up resistor from V_{CC} to prevent excessive current draw. Shutdown mode reduces the total supply current ($I_{DV_{CC}} + I_{V_{CC}}$) to $0.01\mu A$.

SIM/Smart Card Insertion/Removal

The SIM/smart card specifications require that the card-side pins (V_{CC} , CLK, RST, IO) be at ground potential prior to inserting the SIM/smart card. For applications using the MAX1686H (Figure 4), the easi-

est way to achieve this is by shutting down the MAX1686H or by driving \overline{SHDN} (MAX1740 only) low. If specific sequencing is desired, pull IO low by driving either DATA or DDRV (MAX1741 only) low, and pull CLK and RST low by driving CIN and RIN low, respectively.

ESD Protection

As with all Maxim devices, ESD-protection structures on all pins protect against electrostatic discharges (ESDs) encountered during handling and assembly. For further protection during card insertion and removal, the pins that connect to the card socket (CLK, RST, IO, V_{CC} , and GND) provide protection against $\pm 10kV$ of ESD, according to the Human Body Model. The ESD structures withstand high ESD in all states: normal operation, shutdown, and power-down. After an ESD event, the MAX1740/MAX1741 continue working without latching.

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report documenting test setup, test methodology, and test results.

Human Body Model

Figure 3a shows the Human Body Model, and Figure 3b shows the current waveform it generates when discharged into a low impedance. This model consists of a $100pF$ capacitor charged to the ESD voltage of inter-

est, which is then discharged into the test device through a 1.5k Ω resistor.

Applications Information

SIM/Smart Card Interface

To provide 5V when interfacing with a 5V SIM/smart card, 3V systems require a DC-DC converter. The MAX1686H +5V regulating charge pump for SIM cards provides 0V/3V/5V for full compatibility with SIM/smart card specifications. Figure 4 shows the charge pump for SIM card applications. Alternatively, the MAX619 generates a regulated 5V from input voltages as low as 2V.

SPI/QSPI/MICROWIRE Interface

The MAX1740/MAX1741 are also useful as 3V/5V level shifters in SPI, QSPI, and MICROWIRE applications (Figure 5). On the slave side, connect CLK to SCLK, RST to \overline{CS} , and IO to DOUT and DIN. The unidirectional level shifters transfer chip select and clock signals to the slave device(s), while the bidirectional level shifter transfers data.
