technology available in DIP and SOP packages.
The HCF4053B analog multiplexer/demultiplexer is a digitally controlled analog switch having low ON impedance and very low OFF leakage current. This multiplexer circuit dissipate extremely low quiescent power over the full $V_{DD} - V_{SS}$ and $V_{DD} - V_{EE}$ supply voltage range, independent of the logic state of the control signals.

When a logic "1" is present at the inhibit input terminal all channel are off. This device is a triple 2-channel multiplexer having three separate digital control inputs, A, B, and C, and an inhibit input. Each control input selects one of a pair of channels which are connected in a single pole double-throw configuration.

TYPICAL BIAS VOLTAGES

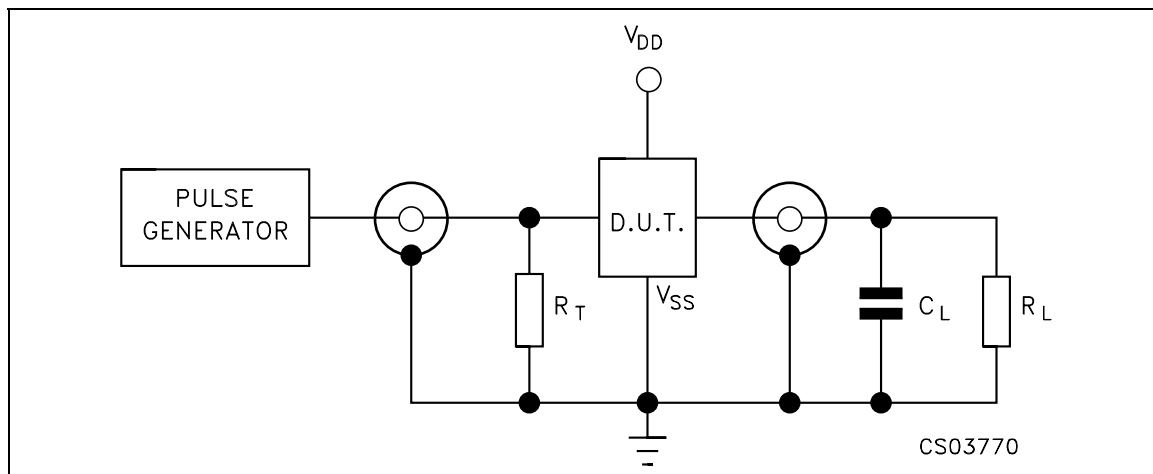

The ADDRESS (digital-control inputs) and INHIBIT logic levels are : "0"= V_{SS} and "1"= V_{DD} . The analog signal (through the TG) may swing from V_{EE} to V_{DD} .

SPECIAL CONSIDERATIONS

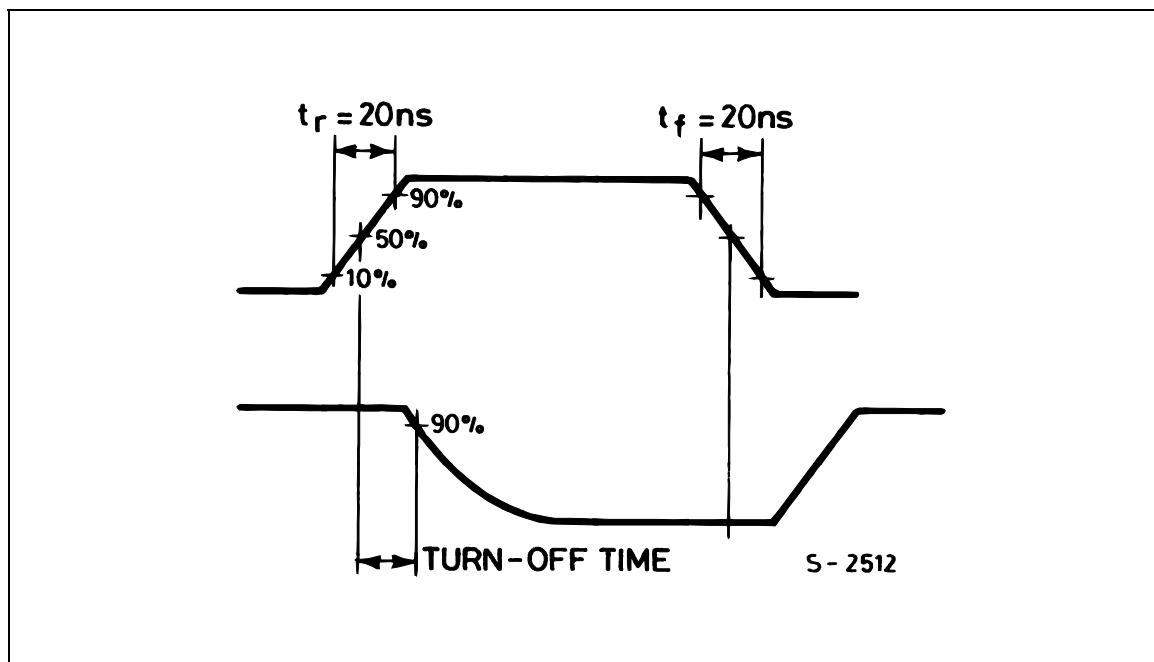

Control of analog signals up to 20V peak to peak can be achieved by digital signal amplitudes of 4.5 to 20V (if $V_{DD} - V_{SS} = 3V$, a $V_{DD} - V_{EE}$ of up to 13V can be controlled; for $V_{DD} - V_{EE}$ level differences above 13V, a $V_{DD} - V_{SS}$ of at least 4.5V is required. For example, if $V_{DD} = +5V$, $V_{SS} = 0V$, and $V_{EE} = -13.5V$, analog signals from -13.5V to 4.5V can be controlled by digital inputs of 0 to 4.5V. In

certain applications, the external load resistor current may include both V_{DD} and signal-line components. To avoid drawing V_{DD} current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed 0.8V (calculated from R_{ON} values shown in DC SPECIFICATIONS). No V_{DD} current will flow through R_L if the switch current flows into leads 4, 14 and 15.

TEST CIRCUIT

$C_L = 50pF$ or equivalent (includes jig and probe capacitance)
 $R_L = 200K\Omega$
 $R_T = Z_{OUT}$ of pulse generator (typically 50 Ω)
