MAXIM

Monolithic CMOS Analog Multiplexers

General Description

Maxim's DG506A/DG507A are monolithic CMOS analog multiplexers. The DG506A is a single 16-channel (1 of 16) multiplexer and the DG507A is a differential 8-channel (2 of 16) multiplexer.

Both devices feature break-before-make switching. Maxim guarantees that these multiplexers will not latch-up if the power supplies are turned off with the input signals still present as long as absolute maximum ratings are not violated. The multiplexers operate over a wide range of power supplies from ±4.5V to ±18V.

Compared to the original manufacturer's devices, Maxim's DG506A/DG507A consume significantly less power, making them ideal for portable equipment.

Maxim's DG506A/DG507A meet or exceed the specifications of, and are drop-in replacements for Intersil's IH6116 and IH6216, Siliconix's DG506A and DG507A, and Harris' HI506 and HI507.

Applications

Control Systems

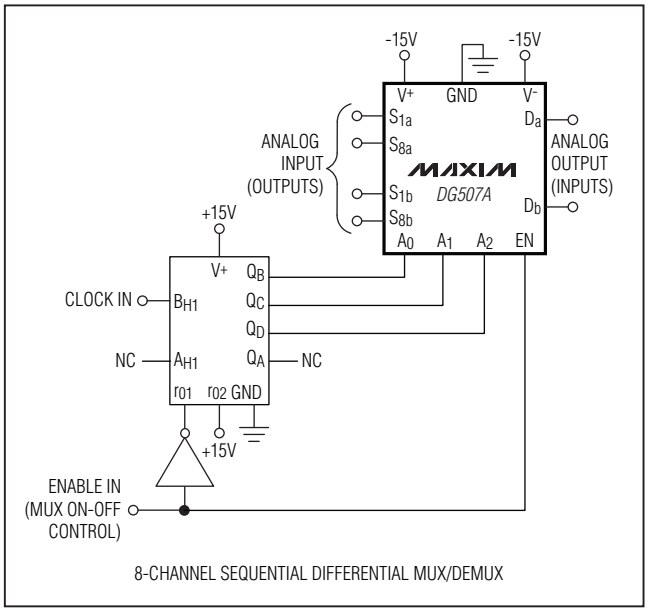
Data Logging Systems

Aircraft Heads Up Displays

Data Acquisition Systems

Signal Routing

Typical Operating Circuit



8-CHANNEL SEQUENTIAL DIFFERENTIAL MUX/DEMUX

Features

- ♦ **Improved 2nd Source**
- ♦ **Pin Compatible with Harris, Siliconix, Intersil**
- ♦ **Operable with ±4.5V to ±18V Supplies**
- ♦ **Symmetrical, Bidirectional Operation**
- ♦ **Logic and Enable Inputs, TTL and CMOS Compatible**
- ♦ **Latch-Up Proof Construction**
- ♦ **Monolithic, Low-Power CMOS Design**

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS (Overtemperature) (continued)

(V+ = 15V, V- = -15V, V_{GND} = 0V, T_A = over temperature range, unless otherwise noted.)

Note 1: Signals on S_X, D_X, or IN_X exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
Note 2: The algebraic convention whereby the most negative value is a minimum, and the most positive value is a maximum, is used in this data sheet.
Note 3: Typical values are for design aid only, not guaranteed nor subject to production testing.
Note 4: $I_{D(ON)}$ is leakage from driver into on switch.
Note 5: Off-isolation = 20log x V_O/V_S, V_S = input to off switch, V_D = output due to V_S.
