

Quad, Rail-to-Rail, Fault-Protected, SPST Analog Switches

MAX312F/MAX313F/MAX314F

General Description

The MAX312F/MAX313F/MAX314F are quad, single-pole/single-throw (SPST), fault-protected analog switches. They are pin compatible with the industry-standard nonprotected MAX312/MAX313/MAX314. These switches feature fault-protected inputs and Rail-to-Rail® signal-handling capability. All analog signal terminals are protected from overvoltage faults up to $\pm 36V$ with power on and up to $\pm 40V$ with power off. During a fault condition, the COM_n, NO_n, or NC_n terminal becomes an open circuit and only microamperes of leakage current flow from the source. On-resistance is 10Ω (max) and is matched between switches to 0.5Ω (max) at $+25^\circ C$.

The MAX312F has four normally closed (NC) switches. The MAX313F has four normally open (NO) switches. The MAX314F has two NC and two NO switches. These CMOS switches operate with dual power supplies ranging from $\pm 4.5V$ to $\pm 20V$ or a single supply between $+9V$ and $+36V$. All digital inputs have $+0.8V$ and $+2.4V$ logic thresholds, ensuring both TTL and CMOS logic compatibility when using $\pm 15V$ or a single $+12V$ supply.

For supply voltages of $\pm 5V$, $+5V$, and $+3V$, refer to the MAX4711/MAX4712/MAX4713 data sheet.

Applications

Communications Systems
Signal Routing
Test Equipment
Data Acquisition
Industrial and Process Control Systems
Avionics
Redundant/Backup Systems
ATE
Hot Swap

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.

Functional Diagram appears at end of data sheet.

Pin Configurations continued at end of data sheet.

Features

- ◆ No Power-Supply Sequencing Required
- ◆ Rail-to-Rail Signal Handling
- ◆ All Switches Off with Power Off
- ◆ All Switches Off when V+ is Off and V- is On
- ◆ $\pm 40V$ Fault Protection with Power Off
- ◆ $\pm 36V$ Fault Protection with $\pm 15V$ Supplies
- ◆ Control Line Fault Protection from V- - $0.3V$ to V- + $40V$
- ◆ Pin Compatible with Industry-Standard DG411/DG412/DG413
- ◆ 600ns (typ) Fault Response Time
- ◆ 10Ω (max) R_{ON} with $\pm 15V$ Supplies
- ◆ $\pm 4.5V$ to $\pm 20V$ Dual Supplies
- ◆ $+9V$ to $+36V$ Single Supply
- ◆ TTL- and CMOS-Compatible Logic Inputs with $\pm 15V$ or Single $+9V$ to $+15V$ Supplies

Quad, Rail-to-Rail, Fault-Protected, SPST Analog Switches

ABSOLUTE MAXIMUM RATINGS

(Voltages Referenced to GND.)

V+	-0.3V to +44V
V-	-44V to +0.3V
V+ to V-	-0.3V to +44V
IN ₋	(V- - 0.3V) to (V- + 40V)
NO ₋ , NC ₋ to COM ₋ (Note 1)	-40V to +40V
COM ₋ , NO ₋ , NC ₋ Voltage with Power On (Note 1)	-36V to +36V
COM ₋ , NO ₋ , NC ₋ Voltage with Power Off (Note 1)	-40V to +40V
Peak Current COM ₋ , NO ₋ , NC ₋ (pulsed at 1ms, 10% duty cycle)	±300mA

Continuous Current (any other terminal)	±30mA
Continuous Current (COM ₋ , NO ₋ , NC ₋)	±100mA
Continuous Power Dissipation (T _A = +70°C)	
16-Pin SO (derate 8.7mW/°C above +70°C)	696mW
16-Pin Plastic DIP (derate 10.53mW/°C above +70°C)	842mW
Operating Temperature Range	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +160°C
Lead Temperature (soldering, 10s)	+300°C

Note 1: COM₋, NO₋, and NC₋ pins are fault protected. Signals on COM₋, NO₋, and NC₋ exceeding -36V to +36V may damage the device during power-on conditions. When the power is off, the maximum range is -40V to +40V.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—±15V Dual Supplies

(V₊ = +15V, V₋ = -15V, V_{IH} = +2.4V, V_{IL} = +0.8V, GND = 0V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at T_A = +25°C.) (Notes 2, 3)

Note 2: The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.

Note 3: Electrical specifications at -40°C are guaranteed by design and not production tested.

Note 4: $\Delta R_{ON} = R_{ON(MAX)} - R_{ON(MIN)}$.

Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance over the specified analog signal range.

Note 6: Single-supply leakage parameters are guaranteed by testing with dual supplies at the maximum rated temperature.

Note 7: Guaranteed by design.

Note 8: Off-isolation = $20 \log_{10} [V_{COM}/(V_{NC} \text{ or } V_{NO})]$, VNC or VNO = output, VCOM = input to off switch.

Note 9: Between any two switches.

Detailed Description

The MAX312F/MAX313F/MAX314F are fault-protected CMOS analog switches with unique operation and construction. These switches differ considerably from traditional fault-protection switches, with several advantages. First, they are constructed with two parallel FETs, allowing very low on-resistance when the switch is on. Second, they allow signals on the NO₋ or NC₋ pins that are within, or slightly beyond, the supply rails to be passed through the switch to the COM₋ terminal (or vice versa), allowing true rail-to-rail signal operation. Third, the MAX312F/MAX313F/MAX314F have the same fault-protection performance on any of the NO₋, NC₋, or COM₋ switch inputs. Operation is identical for both fault polarities. The fault protection extends to ±36V from GND with ±15V supplies.

During a fault condition, the particular overvoltage input (COM₋, NO₋, NC₋) pin becomes high impedance regardless of the switch state or load resistance. When power is removed, the fault protection is still in effect. In this case, the COM₋, NO₋, or NC₋ terminals are a virtual open circuit. The fault can be up to ±40V with power off. The switches turn off when V₊ is not powered, regardless of V₋.

Pin Compatibility

These switches have identical pinouts to common non-fault-protected CMOS switches. They allow for carefree

direct replacement in existing printed circuit boards since the NO₋, NC₋, and COM₋ pins of each switch are fault protected.

Internal Construction

Internal construction is shown in Figure 1, with the analog signal paths shown in bold. A single NO switch is shown. The NC configuration is identical except the logic-level translator becomes an inverter. The analog switch is formed by the parallel combination of N-channel FET (N1) and P-channel FET (P1), which are driven on and off simultaneously according to the input fault condition and the logic-level state.

Normal Operation

Two comparators continuously compare the voltage on the COM₋, NO₋, and NC₋ pins with V₊ and V₋. When the signal on COM₋, NO₋, or NC₋ is between V₊ and V₋, the switch acts normally, with FETs N1 and P1 turning on and off in response to IN₋ signals. The parallel combination of N1 and P1 forms a low-value resistor between NO₋ (or NC₋) and COM₋ so that signals pass equally well in either direction.

Positive Fault Condition

When the signal on NO₋ (or NC₋) and COM₋ exceeds V₊, the high-fault comparator output is high, turning off FETs N1 and P1. This makes the NO₋ (or NC₋) and COM₋ pins high impedance regardless of the switch

Quad, Rail-to-Rail, Fault-Protected, SPST Analog Switches

MAX312F/MAX313F/MAX314F

state. If the switch state is off, all FETs are turned off and both NO₋ (or NC₋) and COM₋ are high impedance.

Negative Fault Condition

When the signal on NO₋ (or NC₋) and COM₋ exceeds V₋, the low-fault comparator output is high, turning off FETs N1 and P1. This makes the NO₋ (or NC₋) and COM₋ pins high impedance regardless of the switch state. If the switch state is off, all FETs are turned off and both NO₋ (or NC₋) and COM₋ are high impedance.

Transient Fault Response and Recovery

When a fast rise-time and fall-time transient on NO₋, NC₋, or COM₋ exceeds V₊ or V₋, the output follows the input to the supply rail with only a few nanoseconds delay. This delay is due to the switch on-resistance and circuit capacitance to ground. When the input transient returns to within the supply rails, however, there is a longer output recovery time delay. For positive faults, the recovery time is typically 1μs. For negative faults, the recovery time is typically 0.6μs. These values depend on the output resistance and capacitance, and are not production tested or guaranteed. The delays are not dependent on the fault amplitude. Higher load resistance and capacitance increase recovery times.

Fault-Protection Voltage and Power Off

The maximum fault voltage on the NO₋ (or NC₋) and COM₋ pins is ±36V with power applied and ±40V with power off.

Failure Modes

Exceeding the fault-protection voltage limits on NO₋, NC₋, or COM₋, even for very short periods, can cause the device to fail (see the *Absolute Maximum Ratings*). The failure modes may not be obvious, and failure in one switch may or may not affect other switches in the same package.

Ground

There is no galvanic connection between the analog signal paths and GND. The analog signal paths consist of an N-channel and P-channel MOSFET with their sources and drains paralleled and their gates driven out of phase to V₊ and V₋ by the logic-level translators. However, the potential of the analog signals must be defined or at least limited with respect to GND.

V₊ and GND power the internal logic and logic-level translators and set the input logic thresholds. The logic-level translators convert the logic levels to switched V₊ and V₋ signals to drive the gates of the analog switches. This drive signal is the only connection between the power supplies and the analog signals.

Bipolar Supplies

The MAX312F/MAX313F/MAX314F operate with bipolar supplies between ±4.5V and ±20V. The V₊ and V₋ supplies need not be symmetrical, but their difference cannot exceed the absolute maximum rating of 44V.

Single Supply

The MAX312F/MAX313F/MAX314F operate from a single supply between +9V and +36V when V₋ is connected to GND.
