MP3/USB 2.0 High Speed Switch with Negative Signal Handling and Low Power Shutdown

ISL54209

ISL54209

The Intersil ISL54209 dual SPDT (Single Pole/Double Throw) switch combines low distortion audio and accurate USB 2.0 high speed data (480Mbps) signal switching in the same low voltage device. When operated with a 2.5V to 5.0V single supply, this analog switch allows audio signal swings below ground, allowing for the use of a common USB and audio headphone connector in Personal Media Players and other portable battery powered devices.

The ISL54209 logic control pins are 1.8V compatible, which allows for control via a standard µcontroller.

The ISL54209 has an audio enable control pin to open all switches and put the part in a low power state. In this state, the device draws typically 1nA of current.

The ISL54209 is available in a small 10 Ld 1.8mm x 1.4mm or 2.1mmx 1.6mm ultra-thin µTQFN packages and a 10 Ld 3mmx3mm TDFN package. It operates over a temperature range of -40°C to +85°C.

Features

- High Speed (480Mbps) and Full Speed (12Mbps) Signaling Capability per USB 2.0
- Low Distortion Negative Signal Capability
- Low Power Shutdown State
- Low Distortion Headphone Audio Signals
  - THD+N at 1mW into 32Ω Load. . . . . <0.013%
- Crosstalk (100kHz). . . . . -95dB
- OFF-Isolation (100kHz). 95dB
- Single Supply Operation (V_{DD}) . . . . . 2.5V to 5.0V
- -3dB Bandwidth USB Switch 736MHz
- Available in µTQFN and TDFN Packages
- COM Pins Over-voltage Tolerant to 5.5V
- Compliant with USB 2.0 Short Circuit Requirements Without Additional External Components
- Pb-Free (RoHS Compliant)

Applications* (see page 16)

- MP3 and other Personal Media Players
- Cellular/Mobile Phones
- PDAs
- Audio/USB Switching

USB Signal Range . . . . . 0V to V_{DD}

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

6. Signals on D+, D-, L, R, COM-, COM+, CTRL and IN exceeding V_{DD} or GND by specified amount are clamped. Limit current to maximum current ratings.
7. θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
8. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
9. For θ_{JC}, the "case temp" location is the center of the exposed metal pad on the package underside.
10. For θ_{JC}, the "case temp" location is taken at the package top center.

NOTES:

11. V_{LOGIC} = Input voltage to perform proper function.
12. The algebraic convention, whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
13. Parameters with MIN and/or MAX limits are 100% tested at +25°C, unless otherwise specified. Temperature limits established by characterization and are not production tested.
14. Flatness is defined as the difference between maximum and minimum value of ON-resistance over the specified analog signal range.
15. Limits established by characterization and are not production tested.
16. r_{ON} matching between channels is calculated by subtracting the channel with the highest max r_{ON} value from the channel with lowest max r_{ON} value, between L and R or between D+ and D-.

Detailed Description

The ISL54209 device is a dual single pole/double throw (SPDT) analog switch that operates from a single DC power supply in the range of 2.5V to 5.0V. It was designed to function as a dual 2 to 1 multiplexer to select between USB differential data signals and audio L and R stereo signals. It comes in tiny µTQFN and TDFN packages for use in MP3 players, PDAs, cellular phones and other personal media players.

The part consists of two 2.5Ω audio switches and two 5Ω USB switches. The audio switches can accept signals that swing below ground. They were designed to pass audio left and right stereo signals, that are ground referenced, with minimal distortion. The USB switches were designed to pass high-speed USB differential data signals with minimal edge and phase distortion.

The ISL54209 was specifically designed for MP3 players, personal media players and cellular phone applications that need to combine the audio headphone jack and the USB data connector into a single shared connector, thereby saving space and component cost. "Typical Application Block Diagrams" on page 10 of this functionality are shown in Figures 8 and 9.

The ISL54209 has a single logic control pin (IN) that selects between the audio switches and the USB switches. This pin can be driven Low or High to switch between the audio CODEC drivers and USB transceiver of the MP3 player or cellular phone. The ISL54209 also contains a logic control pin (CTRL) that when driven Low while IN is Low, opens all switches and puts the part into a low power state, drawing typically 1nA of I_{DD} current.

Detailed descriptions of the two types of switches are provided in the following sections.

Audio Switches

The two audio switches (L, R) are 2.5Ω switches that can pass signals that swing below ground by as much as 1.5V. They were designed to pass ground reference stereo signals with minimal insertion loss and very low distortion over a ±1V signal range.

Crosstalk between the audio channels is -110dB over the audio band. Crosstalk between the audio channel and USB channel is -95dB at 100kHz. These switches have excellent OFF-isolation, 114dB, over the audio band with a 32Ω load.

Over a signal range of ±1V ($0.707V_{RMS}$) with VDD > 2.7V, these switches have an extremely low r_{ON} resistance variation. They can pass ground referenced audio signals with very low distortion (<0.06% THD+N) when delivering 15.6mW into a 32Ω headphone speaker load. See Figures 10 and 11.

These switches are bi-directional switches. In typical applications, the audio drivers would be connected at the L and R side of the switch and the speaker loads would be connected at the COM side of the switch.

The audio switches are active (turned ON) whenever the IN voltage is ≤ 0.5V or floating and the CTRL voltage ≥ to 1.4V.

USB Switches

The two USB switches (D+, D-) are bidirectional switches that can pass rail-to-rail signals. When powered with a 3.3V supply, these switches have a nominal r_{ON} of 5Ω over the signal range of 0V to 400mV with a r_{ON} flatness of 0.45Ω. The r_{ON} matching between the D+ and D- switches over this signal range is only 0.05Ω ensuring minimal impact by the switches to USB high speed signal transitions. As the signal level increases, the r_{ON} resistance increases. At a signal level of 3.3V, the switch resistance is nominally 25Ω.

The USB switches were specifically designed to pass USB 2.0 high-speed (480Mbps) differential signals typically in the range of 0V to 400mV. They have low capacitance and high bandwidth to pass the USB high-speed signals with minimum edge and phase distortion to meet USB 2.0 high speed signal quality specifications. See Figure 12.

The USB switches can also pass USB full-speed signals (12Mbps) with minimal distortion and meet all the USB requirements for USB 2.0 full-speed signaling. See Figure 13 for Full-speed Eye Pattern taken with switch in the signal path.

The USB switches are active (turned ON) whenever the IN voltage is ≥ to 1.4V.

COM+, COM-, 1D-, 1D+, 2D-, AND 2D+ ARE OVERVOLTAGE TOLERANT UP TO 5.5V AND DOWN TO -1.5V

For normal operation, the signal range for the USB switches is from -1V to V_{DD}. During normal operation, the signal voltage at D- and D+ should not be allowed to exceed the V_{DD} voltage rail or go below ground by more than -1.0V. However, the ISL54209, with a VDD supply voltage in the range of 0V to 5.0V, can withstand an overvoltage of up to 5.5V or down to -1.5V applied at its COM pins (COM-, COM+) and/or USB signal pins (1D-, 1D+, 2D-, 2D+) without damage. In this overvoltage condition, the part draws <1mA of current and causes no stress to the IC. Note: When in the overvoltage state, the fault voltage at a COM pin will pass thru the USB switch to the signal side of the switch, so the media player's USB transceiver must have protection circuitry to protect it from damage.

ISL54209 Operation

The following will discuss using the ISL54209 in the "Typical Application Block Diagrams" on page 10 shown in Figures 8 and 9.

VDD SUPPLY

The DC power supply connected at VDD pin provides the required bias voltage for proper switch operation. The

part can operate with a supply voltage in the range of 2.5V to 5.0V.

In a typical USB/Audio application for portable battery powered devices, the V_{DD} voltage will come from a battery or an LDO and be in the range of 2.7V to 3.6V. For best possible USB full-speed operation (12Mbps), it is recommended that the V_{DD} voltage be $\geq$ 2.5V in order to get a USB data signal level above 2.5V.

LOGIC CONTROL

The state of the ISL54209 device is determined by the voltage at the IN pin and the CTRL pin. These logic pins are 1.8V logic compatible when V_{DD} is in the range of 2.7V to 3.6V and can be controlled by a standard microprocessor. The part has three states or modes of operation. The Audio Mode, USB Mode and the Low Power Mode. Refer to the "Truth Table" on page 2.

The IN and CTRL pins are internally pulled low through a 4MΩ resistor to ground and can be left floating or tri-stated by the microprocessor. The CTRL control pin is only active when IN is logic "0".

Logic control voltage levels:

IN = Logic "0" (Low) when $V_{IN} \leq$ 0.5V or Floating.
IN = Logic "1" (High) when $V_{IN} \geq$ 1.4V
CTRL = Logic "0" (Low) when $\leq$ 0.5V or Floating.
CTRL = Logic "1" (High) when $\geq$ 1.4V

Audio Mode

If the IN pin = Logic "0" and CTRL pin = Logic "1", the part will be in the Audio mode. In Audio mode, the L (left) and R (right) 2.5Ω audio switches are ON and the D- and D+ 5Ω switches are OFF (high impedance).

When nothing is plugged into the common connector or a headphone is plugged into the common connector, the µprocessor will sense that there is no voltage at the V_{BUS} pin of the connector and will drive and hold the IN control pin of the ISL54209 low. As long as CTRL = Logic "1," the ISL54209 part will be in the audio mode and the audio drivers of the media player can drive the headphones and play music.

USB Mode

If the IN pin = Logic "1" and the CTRL pin = Logic "0" or Logic "1", the part will go into USB mode. In USB mode, the D- and D+ 5Ω switches are ON and the L and R 2.5Ω audio switches are OFF (high impedance).

When a USB cable from a computer or USB hub is connected at the common connector, the µprocessor will sense the presence of the 5V V_{BUS} and drive the IN pin voltage high. The ISL54209 part will go into the USB mode. In USB mode, the computer or USB hub transceiver and the MP3 player or cell phone USB transceiver are connected and digital data will be able to be transmitted back and forth.

When the USB cable is disconnected, the µprocessor will sense that the 5V V_{BUS} voltage is no longer connected and will drive the IN pin low and put the part back into the Audio or Low Power Mode.

Low Power Mode

If the IN pin = Logic "0" and CTRL pin = Logic "0", the part will be in the Low Power mode. In the Low Power mode, the audio switches and the USB switches are OFF. In this state, the device draws typically 1nA of current.

In Low Power mode, the OFF-isolation and crosstalk between switch cells is minimal for negative swinging signals. Care should be taken to avoid negative swinging signals in this mode of operation. In typical applications, the Low Power state will be applied to the ISL54209 part when the portable media player is in its sleep or hibernate mode to conserve battery power. In the sleep mode, no audio or USB signals are applied to the part.

USING THE COMPUTER V_{BUS} VOLTAGE TO DRIVE THE "IN" PIN

Rather than using a microprocessor to control the IN logic pin, one can directly drive the IN pin using the 5V V_{BUS} voltage from the computer or USB hub. See Figure 9 "Typical Application Block Diagrams" on page 10.

When a headphone or nothing is connected at the common connector, the internal 4MΩ pull-down will pull the IN pin low, putting the ISL54209 in the Audio or Low Power mode, depending on the condition of the CTRL pin.

When a USB cable is connected at the common connector, the voltage at the IN pin will be driven to 5V and the part will automatically go into the USB mode.

When the USB cable is disconnected from the common connector, the voltage at the IN pin will be pulled low by the pull-down resistor and return to the Audio or Low Power mode, depending on the condition of the CTRL pin.

Note: The ISL54209 contains an internal diode between the IN pin and VDD pin. Whenever the IN voltage is greater than the V_{DD} voltage by more than 0.7V, current will flow through this diode into the V_{DD} power supply bus. An external series resistor in the range of 100kΩ to 500kΩ is required at the IN logic pin to limit the current when driving it with the V_{BUS} voltage. This allows the V_{BUS} voltage from a computer or USB hub (4.4V to 5.25V) to drive the IN pin while the V_{DD} voltage is in the range of 2.5V to 3.6V. A 500kΩ resistor will limit the current to 2.76µA and still allow the IN logic voltage to go to around 3.67V, which is will above the required $V_{IN}H$ level of 1.4V. A smaller series resistor can be used but more current will flow.

Typical Performance Curves T_A = +25°C, Unless Otherwise Specified.

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
3/8/10	FN6627.4	Made correction to Tjc in Thermal information and corresponding notes as follows: 2.1x1.6 uTQFN package from "48.3" to "100" and 1.8x1.4 uTQFN package from "61.9" to "105". Added note that is "not direct attach" for both uTQFN packages. Added Latchup to Abs Max Ratings. Updated POD L10.2.1X1.6A to most recent rev. Changes were to convert to new format by moving dimensions from table onto drawing (no dimension changes) Updated POD L10.3X3A to most recent rev. Changes were to convert to new format by moving dimensions from table onto drawing (no dimension changes)
11/24/09	FN6627.3	Added 10 Ld 1.8x1.4 µTQFN option Added MSL note to Ordering Information Added "Boldface limits apply..." to common conditions of Electrical Specifications table. Bolded full temperature specs in spec table. Added Revision History and Products section Added L10.1.8x1.4A package outline drawing Under thermal information for the 2.1 x 1.6 µTQFN & the 1.8 x 1.4 µTQFN, added new boiler plate note for theta JC indicating measurement taken at center of top of package. Moved Note 8 down to 3x3 TDFN.
7/1/08	FN6627.2	Added eval part # to ordering info and updated ESD HBM rating. Applied Intersil standards: Updated pb-free Note 2 to match format, updated over-temp note
4/3/08	FN6627.1	-P2, added Note 3 to order info per Mark Kwoka's new verbiage based on lead finish. Update cross refs accordingly -P3, changed ESD and added apps info for the VBUS control -P5, Note 10 revised to: "Parts are 100% tested at +25°C. Temperature limits established by characterization and are not production tested." from "Parts are 100% tested at +25°C. Over-temperature limits established by characterization and are not production tested."
12/20/07	FN6627.0	Initial Release

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: ISL54209

To report errors or suggestions for this datasheet, please go to www.intersil.com/askourstaff

FITs are available from our website at http://rel.intersil.com/reports/search.php

For additional products, see www.intersil.com/product_tree

Intersil products are manufactured, assembled and tested utilizing ISO9000 quality systems as noted in the quality certifications found at www.intersil.com/design/quality

For information regarding Intersil Corporation and its products, see www.intersil.com
