

# Telephone Tone Ringer Bipolar Linear/I<sup>2</sup>L

**Features**

- Complete Telephone Bell Replacement Circuit with Minimum External Components
- On-Chip Diode Bridge and Transient Protection
- Direct Drive for Piezoelectric Transducers
- Push Pull Output Stage for Greater Output Power Capability
- Base Frequency Options
  - 34017A-1: 1.0 kHz
  - 34017A-2: 2.0 kHz
  - 34017A-3: 500 Hz
- Input Impedance Signature Meets Bell and EIA Standards
- Rejects Rotary Dial Transient

Table 1. 34017A Terminal Definitions

Terminal Number	Terminal Name	Terminal Function	Formal Name	Definition
1, 8	AC1, AC2			The input terminals to the full-wave diode bridge. The AC ringing signal from the telephone line energizes the ringer through this bridge.
5	RS			The input of the threshold comparator to which diode bridge current is mirrored and sensed through an external resistor (R3). Nominal threshold is 1.2 V. This Terminal internally clamps at 1.5 V.
4	RI			The positive supply terminal for the oscillator, frequency divider, and output buffer circuits.
2, 3	RO1, RO2			The tone ringer output terminals through which the sound element is driven.
7	RG			The negative terminal of the diode bridge and the negative supply terminal of the tone generating circuitry.
6	RC			The oscillator terminal for the external resistor and capacitor which control the tone ringer frequencies (R2, C2).

## MAXIMUM RATINGS

## TYPICAL APPLICATIONS

## INTRODUCTION

The 34017A Tone Ringer derives its power supply by rectifying the AC ringing signal. It uses this power to activate a tone generator and drive a piezo-ceramic transducer. The tone generation circuitry includes a relaxation oscillator and frequency dividers which produce high and low frequency tones as well as the tone warble frequency. The relaxation oscillator frequency  $f_O$  is set by resistor R2 and capacitor C2 connected to Terminal RC. The oscillator will operate with  $f_O$  from 1.0 kHz to 10 kHz with the proper choice of external components (see Figure 2).

The frequency of the tone ringer output signal at RO1 and RO2 alternates between  $f_O/4$  to  $f_O/5$ . The warble rate at which the frequency changes is  $f_O/320$  for the 34017A-1,  $f_O/640$  for the 34017A-2 and  $f_O/160$  for the 34017A-3. With a 4.0 kHz oscillator frequency, the 34017A-1 produces 800 Hz and 1000 Hz tones with a 12.5 Hz warble rate. The 34017A-2 generates 1600 Hz and 2000 Hz tones with a similar 12.5 Hz warble frequency from an 8.0 kHz oscillator frequency. The 34017A-3 will produce 400 Hz and 500 Hz tones with a 12.5 Hz warble rate from a 2.0 kHz oscillator frequency. The tone ringer output circuit can source or sink 20 mA with an output voltage swing of 37 V peak-to-peak. Volume control is readily implemented by adding a variable resistance in series with the piezo transducer.

Input signal detection circuitry activates the tone ringer output when the AC line voltage exceeds programmed threshold level. Resistor R3 determines the ringing signal amplitude at which an output signal at RO1 and RO2 will be generated. The AC ringing signal is rectified by the internal diode bridge. The rectified input signal produces a voltage across R3 which is referenced to RG. The voltage across resistor R3 is filtered by capacitor C3 at the input to the threshold circuit.

**Figure 4. Oscillator Period (1/f<sub>O</sub>) versus Oscillator R2 C2 Product**

When the voltage on capacitor C3 exceeds 1.2 V, the threshold comparator enables the tone ringer output. Line transients produced by pulse dialing telephones do not charge capacitor C3 sufficiently to activate the tone ringer output.

Capacitors C1 and C4 and resistor R1 determine the 10 V, 24 Hz signature test impedance. C4 also provides filtering for the output stage power supply to prevent droop in the square wave output signal. Six diodes in series with the rectifying bridge provide the necessary non-linearity for the 2.5 V, 24 Hz signature tests.

An internal shunt voltage regulator between the RI and RG terminals provides DC voltage to power the output stage, oscillator, and frequency dividers. The DC voltage at RI is limited to approximately 22 V in regulation. To protect the IC from telephone line transients, an SCR is triggered when the regulator current exceeds 50 mA. The SCR diverts current from the shunt regulator and reduces the power dissipation within the IC.

## External Components

R1	Line Input Register	R1 affects the tone ringer input impedance. It also influences ringing threshold voltage and limits current from line transients. Range: 2.0 to 10 kΩ.
C1	Line Input Capacitor	C1 AC couples the tone ringer to the telephone line and controls ringer input impedance at low frequencies. Range: 0.4 to 2.0 μF.
R2	Oscillator Resistor	Range: 150 to 300 kΩ.
C2	Oscillator Capacitor	Range: 400 to 3000 pF.
R3	Input Current Sense Resistor	R3 controls the ringing threshold voltage. Increasing R3 decreases the ring-start voltage. Range: 5.0 to 18 kΩ.
C3	Ringing Threshold Filter Capacitor	C3 filters the AC voltage across R3 at the input of the ringing threshold comparator. It also provides dialer transient rejection. Range: 0.5 to 5.0 μF.
C4	Ringer Supply Capacitor	C4 filters supply voltage for the tone generating circuits. It also provides an AC current path for the 10 V <sub>RMS</sub> ringer signature impedance. (Range: 1.0 to 10 μF).
