

# 2.7Gbps Post Amp with Automatic Gain Control

## General Description

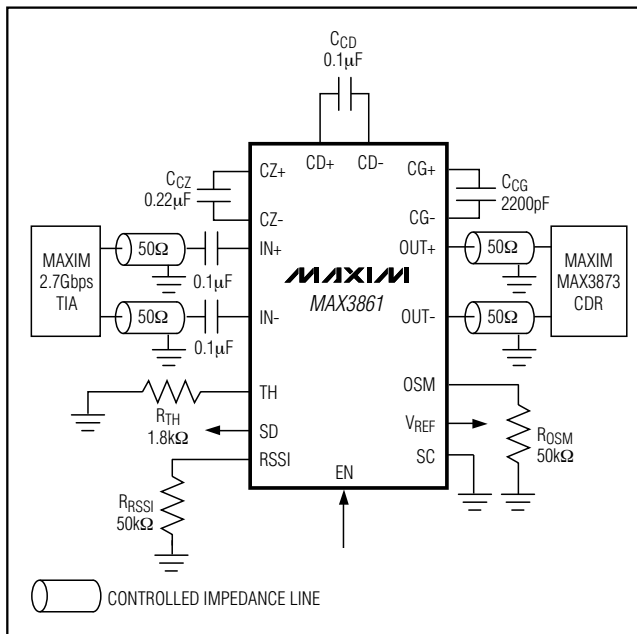

The MAX3861 is a low-power amplifier with automatic gain control (AGC), designed for WDM transmission systems employing optical amplifiers and requiring a vertical threshold adjustment after the post amp. Operating from a single 3.3V supply, this AGC amplifier linearly amplifies/attenuates the input signal while maintaining a fixed output-voltage swing at data rates up to 2.7Gbps. The input and output are on-chip terminated to match 50Ω interfaces.

This amplifier has a small-signal bandwidth of 3.4GHz and an input-referred noise of 0.26mV<sub>RMS</sub>. Over an input signal range of 6mV<sub>P-P</sub> to 1200mV<sub>P-P</sub> (46dB), the MAX3861 delivers a constant output amplitude adjustable from 400mV<sub>P-P</sub> to 920mV<sub>P-P</sub>. Variation in output swing is controlled within 0.2dB over a 16dB input range. The MAX3861 provides a received-signal-strength indicator (RSSI) that is linear, within 2.5%, for input signal levels up to 100mV<sub>P-P</sub> and an input signal detect (SD) with programmable threshold.

## Applications

OC-48/STM-16 Transmission Systems  
WDM Optical Receivers  
Long-Reach Optical Receivers  
Continuous Rate Receivers

## Typical Application Circuit

## Features

- ◆ Single 3.3V Power Supply
- ◆ 72mA Supply Current
- ◆ 3.4GHz Small-Signal Bandwidth
- ◆ 0.26mV<sub>RMS</sub> Input-Referred Noise
- ◆ 6mV<sub>P-P</sub> to 1200mV<sub>P-P</sub> Input Range (46dB)
- ◆ Input Signal Detect with Programmable Threshold
- ◆ RSSI (Linear Up to 100mV<sub>P-P</sub>)
- ◆ Adjustable Output Amplitude
- ◆ 0.2dB Output Voltage Variation (Over 16dB Input Signal Variation)

## Pin Configurations

## 2.7Gbps Post Amp with Automatic Gain Control

### ABSOLUTE MAXIMUM RATINGS

Supply Voltage .....-0.5V to +4.0V  
 Voltage at IN+, IN- .....(V<sub>CC</sub> - 1.5V) to (V<sub>CC</sub> + 0.5V)  
 Voltage at CZ+, CZ-, CG+,  
 CG-, CD+, CD- .....(V<sub>CC</sub> - 3.5V) to (V<sub>CC</sub> + 0.5V)  
 Voltage at SC, SD, EN, TH,  
 OSM, V<sub>REF</sub>, RSSI .....-0.5V to (V<sub>CC</sub> + 0.5V)  
 CML Input Current at IN+, IN- .....25mA

CML Output Current at OUT+, OUT- .....25mA  
 Continuous Power Dissipation T<sub>A</sub> = +85°C  
 (24-Pin QFN and 24-Pin Thin QFN)  
 (derate 20.8mW/°C above +85°C .....1.35W  
 Storage Temperature Range .....-55°C to +150°C  
 Operating Junction Temperature Range .....-55°C to +150°C  
 Lead Temperature (soldering, 10s) .....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +3.0V to +3.6V, T<sub>A</sub> = -40°C to +85°C. Typical values are at V<sub>CC</sub> = +3.3V and T<sub>A</sub> = +25°C, unless otherwise noted.) (Note 1)

**Note 1:** Electrical characteristics are measured or characterized using a 2<sup>23</sup> - 1PRBS at 2.7Gbps with input edge speeds  $\leq 200ps$ , unless otherwise noted. All AC specifications are guaranteed by design and characterization, unless otherwise noted.

**Note 2:** Supply current measurement is taken with AC-coupled inputs and excludes output currents into 50 $\Omega$  loads.

**Note 3:** Minimum gain is defined as  $V_{IN} = 1200mV_{P-P}$  and  $V_{OUT} = 400mV_{P-P}$ . Maximum gain is defined as  $V_{IN} = 6mV_{P-P}$ , and  $V_{OUT} = 920mV_{P-P}$ . Reference gain is measured at 100MHz.

**Note 4:** Power-supply noise rejection is characterized with a 2.7Gbps 1100 pattern on the input. It is calculated by the equation  $PSNR = 20\log(\Delta V_{CC} / (\Delta V_{OUT}))$ , where  $\Delta V_{OUT}$  is the change in differential output voltage because of power-supply noise. See the Power-Supply Noise Rejection vs. Frequency graph in the *Typical Operating Characteristics*.

# 2.7Gbps Post Amp with Automatic Gain Control

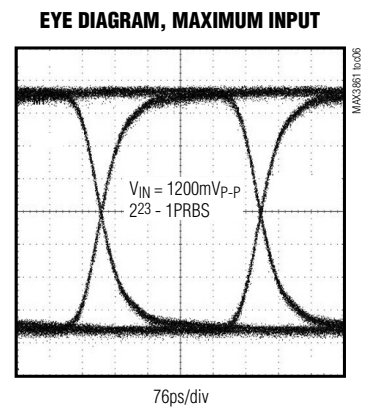

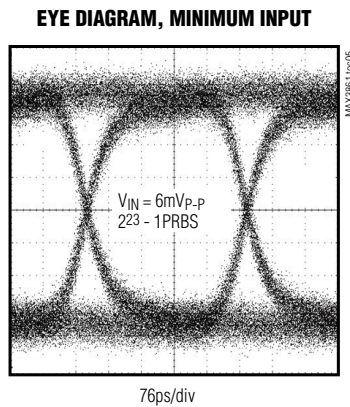

## ELECTRICAL CHARACTERISTICS (continued)

( $V_{CC} = +3.0V$  to  $+3.6V$ ,  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ . Typical values are at  $V_{CC} = +3.3V$  and  $T_A = +25^{\circ}C$ , unless otherwise noted.) (Note 1)

- Note 5:** See the Distribution of Differential Output Offset (Worst-Case Conditions) graph in the *Typical Operating Characteristics*.
- Note 6:** Characterized with a 675Mbps 1-0 pattern.
- Note 7:** Measurements are taken over an input signal range of 16dB.
- Note 8:** Deterministic jitter is defined as the arithmetic sum of PWD (pulse-width distortion) and PDJ (pattern-dependent jitter). Deterministic jitter is the difference between total jitter and random jitter, with system jitter calibrated out. It is measured with a  $2^7$  - 1PRBS, and 80CIDs with DC-coupled outputs.
- Note 9:** The typical input resistance of the SC pin is  $40k\Omega$ .
- Note 10:** AGC loop time constant is measured with a 20dB change in the input and  $V_{SC}$  held constant. With an external capacitor  $C_{CG}$  of  $0.022\mu F$  connected between CG+ and CG-, a typical AGC loop time constant of  $760\mu s$  is achieved.
- Note 11:** SD deassert time depends on the AGC loop time constant set by  $C_{CG}$ .
- Note 12:** SD accuracy is defined as the part-to-part variation of the SD threshold at a fixed  $R_{TH}$  value.
- Note 13:** See the Distribution of SD Hysteresis (Worst-Case Conditions) graph in the *Typical Operating Characteristics*.
- Note 14:** Measurements are taken over an input signal range of 20dB.

## 2.7Gbps Post Amp with Automatic Gain Control

### Pin Description

PIN	NAME	FUNCTION
1	TH	Input Signal Detect Threshold Programming Pin. Attach a resistor between this pin and ground to program the input signal detect assert threshold. Leaving this pin open sets the signal detect threshold to its absolute minimum value ( $<2mV_{P-P}$ ). See the <i>Design Procedure</i> section.
2, 5, 14, 17	V <sub>CC</sub>	Supply Voltage Connection. Connect all V <sub>CC</sub> pins to the board V <sub>CC</sub> plane.
3	IN+	Positive CML Signal Input with On-Chip Termination Resistor
4	IN-	Negative CML Signal Input with On-Chip Termination Resistor
6	EN	Signal Detect Enable. Set high ( $\geq 2.0V$ ) or leave open to enable the input signal detection (RSSI and SD) circuitry. Set low ( $\leq 0.4V$ ) to power down the input signal detection circuitry.
7	V <sub>REF</sub>	Reference Voltage Output (2.0V). Connect this pin to the SC pin for maximum output signal swing.
8	SC	Output Amplitude External Control. Ground SC for minimum output amplitude. Apply 2.0V to SC or connect SC directly to V <sub>REF</sub> for maximum output amplitude.
9, 12, 22	GND	Ground. Connect all GND pins to the board ground plane.
10	CG+	Connection for AGC Loop Capacitor. A capacitor connected between CG+ and CG- sets the AGC loop time constant.
11	CG-	Connection for AGC Loop Capacitor. A capacitor connected between CG+ and CG- sets the AGC loop time constant.
13	OSM	Output Signal Monitor. This DC signal is linearly proportional to the output signal amplitude.
15	OUT-	Negative CML Data Output with On-Chip Back-Termination Resistor
16	OUT+	Positive CML Data Output with On-Chip Back-Termination Resistor
18	SD	Input Signal Detect. Asserts logic low when the input signal level drops below the programmed threshold.
19	RSSI	Received Signal Strength Indicator. Outputs a DC signal linearly proportional to the input signal amplitude.
20	CD-	Connection for Signal Detect Capacitor. A capacitor connected between CD+ and CD- sets the offset-cancellation loop time constant of the input signal detection. See the <i>Detailed Description</i> section.
21	CD+	Connection for Signal Detect Capacitor. A capacitor connected between CD+ and CD- sets the offset-cancellation loop time constant of the input signal detection. See the <i>Detailed Description</i> section.
23	CZ-	Connection for Offset-Cancellation Loop Capacitor. A capacitor connected between CZ+ and CZ- sets the offset-cancellation loop time constant of the main signal path. See the <i>Detailed Description</i> section.
24	CZ+	Connection for Offset-Cancellation Loop Capacitor. A capacitor connected between CZ+ and CZ- sets the offset-cancellation loop time constant of the main signal path. See the <i>Detailed Description</i> section.
EP	Exposed Pad	Maxim recommends connecting the exposed pad to board ground.

## 2.7Gbps Post Amp with Automatic Gain Control

### Detailed Description

Figure 1 is a functional diagram of the MAX3861 automatic gain-control amplifier. The MAX3861 is divided into three sections: main signal path, input signal detection, and output signal detection.

#### Main Signal Path

The main signal path consists of variable gain amplifiers with CML output levels and an offset-cancellation loop. This configuration allows for overall gains from -9.5dB to 43.5dB.

#### Offset-Cancellation Loop

The offset-cancellation loop partially reduces additional offset at the input. In communications systems using NRZ data with a 50% duty cycle, pulse-width distortion present in the signal or generated by the transimpedance amplifier appears as input offset and is partially removed by the offset-cancellation loop. An external capacitor is required between CZ+ and CZ- to compensate the offset-cancellation loop and determine the lower 3dB frequency of the signal path.

#### Input Signal Detection and SD Circuitry

The input signal detection circuitry consists of variable gain amplifiers and threshold voltages. Input signal detection information is compared to an internal reference and creates the RSSI voltage and an internal reference signal. The signal detect (SD) circuitry indicates when the input signal is below the programmed threshold by comparing a voltage proportional to the RSSI signal with internally generated control voltages. The SD threshold is set by a control voltage developed across the external TH resistor ( $R_{TH}$ ). Two control voltages, V<sub>ASSERT</sub> and V<sub>DEASSERT</sub>, define the signal detect assert and deassert levels. To prevent SD chatter in the region of the programmed threshold, 2.8dB to 6.3dB of hysteresis is built into the SD assert/deassert function. Thus, once asserted, SD is not deasserted until sufficient gain is retained. When input signal detection (SD and RSSI) is not required, connect EN to a TTL low to power down this circuitry.

Figure 1. Functional Diagram

#### Output Signal Monitor and Amplitude Control

Output amplitude typically can be adjusted from 400mV<sub>P-P</sub> to 920mV<sub>P-P</sub> by applying a control voltage (0V to 2.0V) to the SC pin. See the Output Signal Amplitude vs. SC Pin Voltage graph in the *Typical Operating Characteristics*. Connect the V<sub>REF</sub> pin (2.0V) to the SC pin for maximum output amplitude. The output signal monitor pin provides a DC voltage linearly proportional to the output signal.

### Design Procedure

#### Program the SD Threshold

The SD threshold is programmed by an external resistor,  $R_{TH}$ , between the range of 2mV<sub>P-P</sub> to 100mV<sub>P-P</sub>. The circuit is designed to have approximately 4.5dB of hysteresis over the full range. See the Signal Detect Threshold vs.  $R_{TH}$  graph in the *Typical Operating Characteristics* for proper sizing.

## 2.7Gbps Post Amp with Automatic Gain Control

### Select the Coupling Capacitors

When AC-coupling is desired, select coupling capacitors  $C_{IN}$  and  $C_{OUT}$  to minimize the receiver's deterministic jitter. Jitter is decreased as the input low-frequency cutoff ( $f_{IN}$ ) is decreased.

$$f_{IN} = \frac{1}{2\pi(50)(C_{IN})}$$

For ATM/SONET or other applications using scrambled NRZ data, select ( $C_{IN}$ ,  $C_{OUT}$ )  $\geq 0.1\mu\text{F}$ , which provides  $f_{IN} < 32\text{kHz}$ . For Fibre Channel, Gigabit Ethernet, and other applications using 8B/10B data coding, select ( $C_{IN}$ ,  $C_{OUT}$ )  $\geq 0.01\mu\text{F}$ , which provides  $f_{IN} < 320\text{kHz}$ .

### Setting the Offset-Cancellation Loop Time Constant for Input Signal Detection Circuitry (Selecting $C_{CD}$ )

The capacitor between  $CD+$  and  $CD-$  determines the time constant of the input signal detection DC offset-cancellation loop. A value of  $0.1\mu\text{F}$  for  $C_{CD}$  provides a low-frequency cutoff ( $f_C$ ) below  $10\text{kHz}$ . If a lower cutoff frequency is desired,  $0.22\mu\text{F}$  gives  $f_C = 4.5\text{kHz}$  and  $0.47\mu\text{F}$  gives  $f_C = 2.1\text{kHz}$ . To guarantee stable operation, do not use a capacitor of less than  $0.01\mu\text{F}$ .

Figure 2. Input Interface

### Setting the Offset-Cancellation Loop Time Constant for the Main Signal Path (Selecting $C_{CZ}$ )

The capacitor between  $CZ+$  and  $CZ-$  determines the time constant of the signal path DC offset-cancellation loop. To maintain stability, keep a one-decade separation between  $f_{IN}$  and the low-frequency cutoff ( $f_{OC}$ ) associated with the DC offset-cancellation circuit. For SONET applications,  $f_{IN} < 32\text{kHz}$ , so  $f_{OCMAX} < 3.2\text{kHz}$ . Therefore,  $C_{CZ} = 0.22\mu\text{F}$  ( $f_{OC} = 2.99\text{kHz}$ ),  $C_{CZ} = 0.47\mu\text{F}$  ( $f_{OC} = 1.4\text{kHz}$ ), or a greater value can be used. To guarantee stable operation, do not use a capacitor of less than  $0.01\mu\text{F}$ .

### Setting the Automatic Gain-Control Loop Time Constant (Selecting $C_{CG}$ )

The automatic gain-control loop time constant is determined by the external capacitor connected between  $CG+$  and  $CG-$ . Maxim recommends a value of at least  $0.0022\mu\text{F}$ .

### Programming the Output Amplitude (Programming the SC Pin)

Output amplitude can be programmed from  $400\text{mV}_{P-P}$  to  $920\text{mV}_{P-P}$  by applying a voltage to the SC pin. See the Output Signal Amplitude vs. SC Pin Voltage graph in the *Typical Operating Characteristics*.
