LT1190

Ultrahigh Speed Operational Amplifier

FEATURES

- Gain Bandwidth Product, A_V = 1: 50MHz
- Slew Rate: 450V/µs
- Low Cost
- Output Current: ±50mA
- Settling Time: 140ns to 0.1%
- Differential Gain Error: 0.1%, (R_L = 1k)
- Differential Phase Error: 0.06°, (R_L = 1k)
- High Open-Loop Gain: 10V/mV Min
- Single Supply 5V Operation
- Output Shutdown

APPLICATIONS

- Video Cable Drivers
- Video Signal Processing
- Fast Integrators
- Pulse Amplifiers
- D/A Current to Voltage Conversion

DESCRIPTION

The LT®1190 is a video operational amplifier optimized for operation on ±5V, and a single 5V supply. Unlike many high speed amplifiers, this amplifier features high open-loop gain, over 85dB, and the ability to drive heavy loads to a full-power bandwidth of 20MHz at $7V_{P-P}$. In addition to its very fast slew rate, the LT1190 features a unity-gain-stable bandwidth of 50MHz and a 75° phase margin, making it extremely easy to use.

Because the LT1190 is a true operational amplifier, it is an ideal choice for wideband signal conditioning, fast integrators, active filters, and applications requiring speed, accuracy and low cost.

The LT1190 is available in 8-pin PDIP and SO packages with standard pinouts. The normally unused Pin 5 is used for a shutdown feature that shuts off the output and reduces power dissipation to a mere 15mW.

Note 1: Absolute maximum ratings are those values beyond which the life of the device may be impaired.

Note 2: A heat sink is required to keep the junction temperature below absolute maximum when the output is shorted.

Note 3: Exceeding the input common mode range may cause the output to invert.

Note 4: Slew rate is measured between ±1V on the output, with a ±3V input step.

Note 5: Full-power bandwidth is calculated from the slew rate measurement:

$FPBW = SR/2\pi V_P$.

Note 6: Settling time measurement techniques are shown in "Take the Guesswork Out of Settling Time Measurements," EDN, September 19, 1985. A_V = –1, R_L = 1k.

Note 7: NTSC (3.58MHz). For R_L = 1k, Diff A_V = 0.1%, Diff Ph = 0.06°.

Note 8: See Applications section for shutdown at elevated temperatures. Do not operate the shutdown above T_J > 125°C.

Note 9: AC parameters are 100% tested on the ceramic and plastic DIP packaged parts (J and N suffix) and are sample tested on every lot of the SO packaged parts (S suffix).

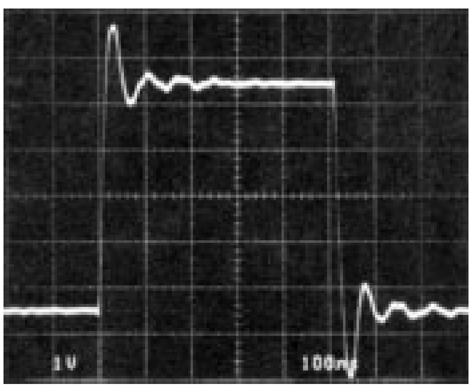
APPLICATIONS INFORMATION

Power Supply Bypassing

The LT1190 is quite tolerant of power supply bypassing. In some applications a 0.1μF ceramic disc capacitor placed 1/2 inch from the amplifier is all that is required. A scope photo of the amplifier output with no supply bypassing is used to demonstrate this bypassing tolerance, R_L = 1kΩ.

No Supply Bypass Capacitors

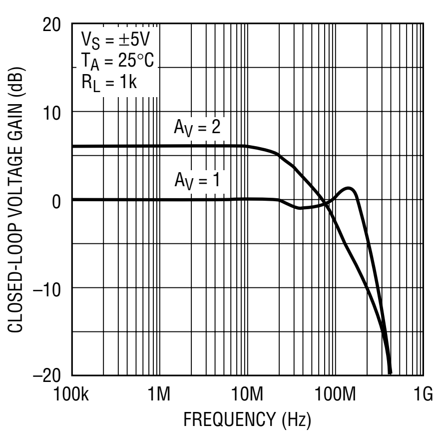


LT1190 • TA04

A_V = –1, IN DEMO BOARD, R_L = 1kΩ

Supply bypassing can also affect the response in the frequency domain. It is possible to see a slight 1dB rise in the frequency response at 130MHz depending on the gain configuration, supply bypass, inductance in the supply leads and printed circuit board layout. This can be further minimized by not using a socket.

Closed-Loop Voltage Gain vs Frequency



LT1190 • TA05

In most applications, and those requiring good settling time, it is important to use multiple bypass capacitors. A 0.1μF ceramic disc in parallel with a 4.7μF tantalum is recommended. Two oscilloscope photos with different bypass conditions are used to illustrate the settling time characteristics of the amplifier. Note that although the output waveform looks acceptable at 1V/DIV, when amplified to 1mV/DIV the settling time to 2mV is 4.244μs for the 0.1μF bypass; the time drops to 163ns with multiple bypass capacitors.

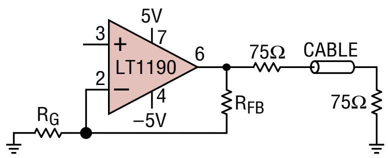
LINEAR TECHNOLOGY

APPLICATIONS INFORMATION

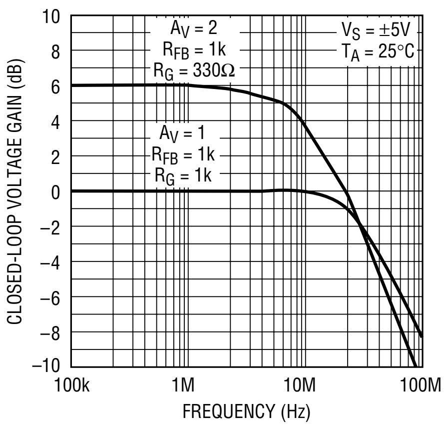
Cable Terminations

The LT1190 operational amplifier has been optimized as a low cost video cable driver. The ±50mA guaranteed output current enables the LT1190 to easily deliver $7.5V_{P\text{-}P}$ into 100Ω, while operating on ±5V supplies or $2.6V_{P\text{-}P}$ on a single 5V supply.

Double Terminated Cable Driver



Cable Driver Voltage Gain vs Frequency



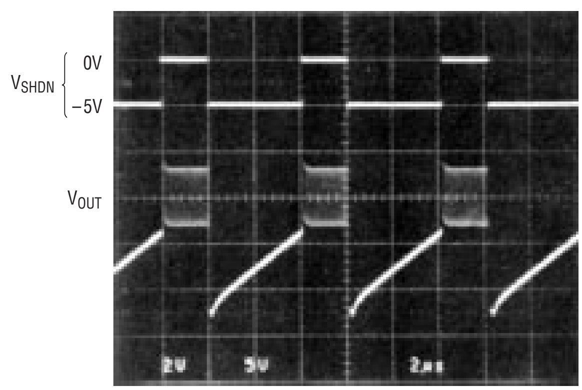
LT1190 • TA08

When driving a cable it is important to terminate the cable to avoid unwanted reflections. This can be done in one of two ways: single termination or double termination. With single termination, the cable must be terminated at the receiving end (75Ω to ground) to absorb unwanted energy. The best performance can be obtained by double termination (75Ω in series with the output of the amplifier, and 75Ω to ground at the other end of the cable). This termination is preferred because reflected energy is absorbed at each end of the cable. When using the double termination technique it is important to note that the signal is attenuated by a factor of 2, or 6dB. This can be compensated for by taking a gain of 2, or 6dB in the amplifier. The cable driver has a –3dB bandwidth in excess of 30MHz while driving the 150Ω load.

Using the Shutdown Feature

The LT1190 has a unique feature that allows the amplifier to be shut down for conserving power or for multiplexing several amplifiers onto a common cable. The amplifier will shut down by taking Pin 5 to V^-. In shutdown, the amplifier dissipates 15mW while maintaining a true high impedance output state of 15kΩ in parallel with the feedback resistors. The amplifiers must be used in a noninverting configuration for MUX applications. In inverting configurations the input signal is fed to the output through the feedback components. The following scope photos show that with very high R_L, the output is truly high impedance; the output slowly decays toward ground. Additionally, when the output is loaded with as little as 1kΩ the amplifier shuts off in 400ns. This shutoff can be under the control of HC CMOS operating between 0V and –5V.

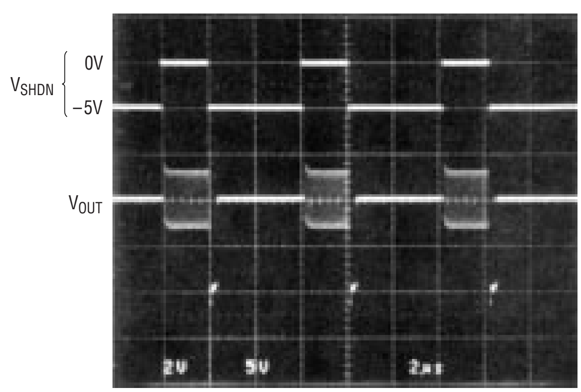
Output Shutdown



LT1190 • TA09

1MHz SINE WAVE GATED OFF WITH SHUTDOWN PIN, $A_V = 1$, R_L = SCOPE PROBE

Output Shutdown



LT1190 • TA10

1MHz SINE WAVE GATED OFF WITH SHUTDOWN PIN, $A_V = 1$, $R_L = 1k\Omega$

APPLICATIONS INFORMATION

The ability to maintain shutoff is shown on the curve Shutdown Supply Current vs Temperature in the Typical Performance Characteristics section. At very high elevated temperatures it is important to hold the shutdown pin close to the negative supply to keep the supply current from increasing.

Murphy Circuits

There are several precautions the user should take when using the LT1190 in order to realize its full capability. Although the LT1190 can drive a 50pF load, isolating the capacitance with 10Ω can be helpful. Precautions primarily have to do with driving large capacitive loads.

Other precautions include:

1. Use a ground plane (see Design Note 50, High Frequency Amplifier Evaluation Board).
2. Do not use high source impedances. The input capacitance of 2pF and R_S = 10k for instance, will give an 8MHz –3dB bandwidth.
3. PC board socket may reduce stability.
4. A feedback resistor of 1k or lower reduces the effects of stray capacitance at the inverting input. (For instance, closed-loop gain of 2 can use R_{FB} = 300Ω and R_G = 300Ω.)

Driving Capacitive Load
