

## AC coupled HDMI level shifter

### Features

- Converts low-swing alternating current (AC) coupled differential input to high-definition multimedia interface (HDMI) rev 1.3 compliant
- HDMI level shifting operation up to 2.7 Gbps per lane
- Integrated 50  $\Omega$  termination resistors for AC-coupled differential inputs
- Input/output transition minimized differential signaling (TMDS) enable/disable
- Output slew rate control on TMDS outputs to minimize electromagnetic interference (EMI)
- Fail-safe outputs for backdrive protection
- No re-timing or configuration required
- Inter-pair output skew < 250 ps
- Intra-pair output skew < 10 ps
- Single power supply of 3.3 V
- ESD protection:  $\pm 6$  KV HBM on all I/O pins
- Integrated display data channel (DDC) level shifters. Pass-gate voltage limiters allow 3.3 V termination on graphics and memory controller hub (GMCH) pins and 5 V DDC termination on HDMI connector pins
- Hot-plug detect (HPD) signal level shifter from HDMI/DVI connector
- Integrated pull-down resistor on HPD\_SINK and OE\_N inputs

### Applications

- Notebooks
- PC motherboards and graphic cards
- Dongles/cable adapters

### Description

The STHDLS101 is a high-speed high-definition multimedia interface (HDMI) level shifter that converts low-swing AC coupled differential input to HDMI 1.3 compliant open-drain current steering RX-terminated differential output. Through the existing PCI-E pins in the graphics and memory controller hub (GMCH) of PCs or notebook motherboards, the pixel clock provides the required bandwidth (1.65 Gbps, 2.25 Gbps) for the video supporting 720p, 1080i, 1080p with a total of 36-bit resolution. The HDMI is multiplexed onto the PCIe pins in the motherboard where the AC coupled HDMI at 1.2 V is output by GMCH. The AC coupled HDMI is then level shifter by this device to 3.3 V DC coupled HDMI output. The STHDLS101 supports up to 2.7 Gbps, which is enough for 12 bits of color depth per channel, as indicated in HDMI rev 1.3. The device operates from a single 3.3 V supply and is available in a 48-pin QFN package.

## 4 Functional description

This section describes the basic functionality of the STHDLS101 device.

### Power supply

The STHDLS101 is powered by a single DC power supply of 3.3 V  $\pm$  10%.

### Clocking

This device does not retime any data. The device contains no state machines. No inputs or outputs of the device are latched or clocked.

### Reset

This device acts as a level shifter, reset is not required.

### OE\_N function

When OE\_N is asserted (low level), the IN\_D and OUT\_D signals are fully functional. Input termination resistors are enabled and any internal bias circuits are turned on.

The OE\_N pin has an internal pull-down that enables the chip if left unconnected.

When OE\_N is de-asserted (high level), the OUT\_D outputs are in high impedance state. The IN\_D input buffers are disabled and the IN\_D termination resistors are disabled. Internal bias circuits for the differential inputs and outputs are turned off. Power consumption of the chip is minimized.

The HPD\_SINK input and HPD\_SOURCE output are not affected by OE\_N. The SCL and SDA pass-gates are not affected by OE\_N.

**Table 3. OE\_N description**

OE_N	Device state	Comments
Asserted (low level) or unconnected	Differential input buffers and output buffers enabled. Input impedance = 50 $\Omega$	Normal functioning state for IN_D to OUT_D level shifting function.
De-asserted (high level)	Low-power state. Differential input buffers and terminations are disabled. Differential input buffers are in high-impedance state. OUT_D level shifting outputs are disabled. OUT_D level shifting outputs are in a high-impedance state. Internal bias currents are turned off.	Intended for lowest power condition when: <ul style="list-style-type: none"> <li>• No display is plugged in or</li> <li>• The level shifted data path is disabled</li> </ul> HPD_SINK input and HPD_SOURCE output are not affected by OE_N. SCL_SOURCE, SCL_SINK, SDA_SOURCE and SDA_SINK signals and functions are not affected by OE_N.

OE_N	IN_Dx	OUT_Dx (TMDS outputs)	Notes
De-asserted (high level)	High-Z	High-Z	Device disabled. Low power state. Internal bias currents are disabled.
Asserted (low level) or unconnected	50 $\Omega$ termination	Enabled	Level shifting mode enabled.

## 5 Maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute maximum rating conditions for extended periods may affect device reliability.

**Table 5. Absolute maximum ratings**

## 6 Application information

### 6.1 Power supply sequencing

A proper power supply sequencing is advised for all CMOS devices. It is recommended to always apply  $V_{CC}$  before applying any signals to the input/output or control pins.

### 6.2 Supply bypassing

Bypass each of the  $V_{CC}$  pins with 0.1  $\mu$ F and 1nF capacitors in parallel as close to the device as possible, with the smaller valued capacitor as close to the  $V_{CC}$  pin of the device as possible.

### 6.3 Differential traces

The high-speed inputs and TMD5 outputs are the most critical parts for the device. There are several considerations to minimize discontinuities on these transmission lines between the connectors and the device.

- a) Maintain 100  $\Omega$  differential transmission line impedance into and out of the device.
- b) Keep an uninterrupted ground plane below the high-speed I/Os.
- c) Keep the ground-path vias to the device as close as possible to allow the shortest return current path.
- d) Layout of the TMD5 differential outputs should be with the shortest stubs from the connectors.

Output trace characteristics affect the performance of the STHDL101. Use controlled impedance traces to match trace impedance to both the transmission medium impedance and termination resistor. Run the differential traces close together to minimize the effects of the noise. Reduce skew by matching the electrical length of the traces. Avoid discontinuities in the differential trace layout. Avoid 90  $^\circ$  C turns and minimize the number of vias to further prevent impedance discontinuities.

## 7 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK<sup>®</sup> packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
