

# Input selector switch for high definition displays

## BA7658AFS

The BA7658AFS is an IC designed for high definition displays, and has an internal selector circuit for broadband RGB signals and HD / VD signals, a synchronization separator circuit, and a NUTEK signal detector circuit. This IC chip simplifies the configuration of input blocks for high-end displays.

### ● Applications

CRT displays, HDTV, video board for personal computer, etc.

### ● Features

- 1) Operates on a single 5V power supply.
- 2) Internal broadband RGB selector with a frequency characteristic of 230MHz ( - 3dB)
- 3) Internal HD / VD selector.
- 4) Internal separator for synchronization signal superimposed on the G signal.
- 5) Internal detector for NUTEK power saving signals.

### ● Absolute maximum ratings (Ta = 25°C)

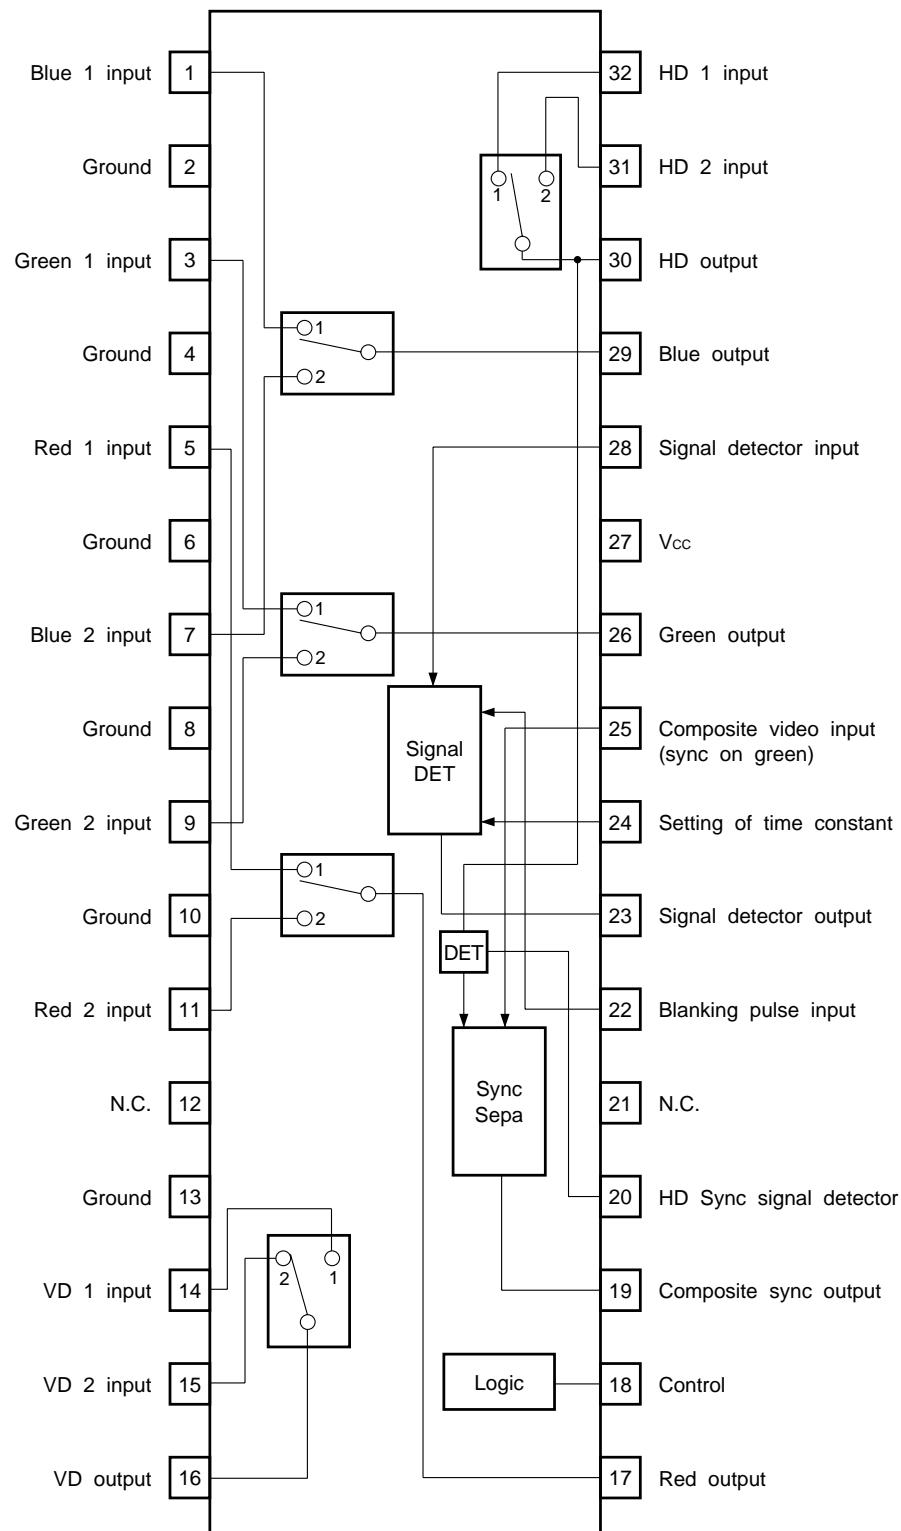

Parameter	Symbol	Limits	Unit
Power supply voltage	Vcc	7.0	V
Power dissipation	Pd	850*	mW
Operating temperature	Topr	- 25 ~ + 75	°C
Storage temperature	Tstg	- 55 ~ + 125	°C

\* Reduced by 8.5mW for each increase in Ta of 1°C over 25°C.

### ● Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Power supply voltage	Vcc	4.5	5.0	5.5	V

## ● Block diagram

## ●Pin descriptions

Pin No.	Pin name	Function
1	Blue 1 input	B1 color signal input

## ● Measurement circuit

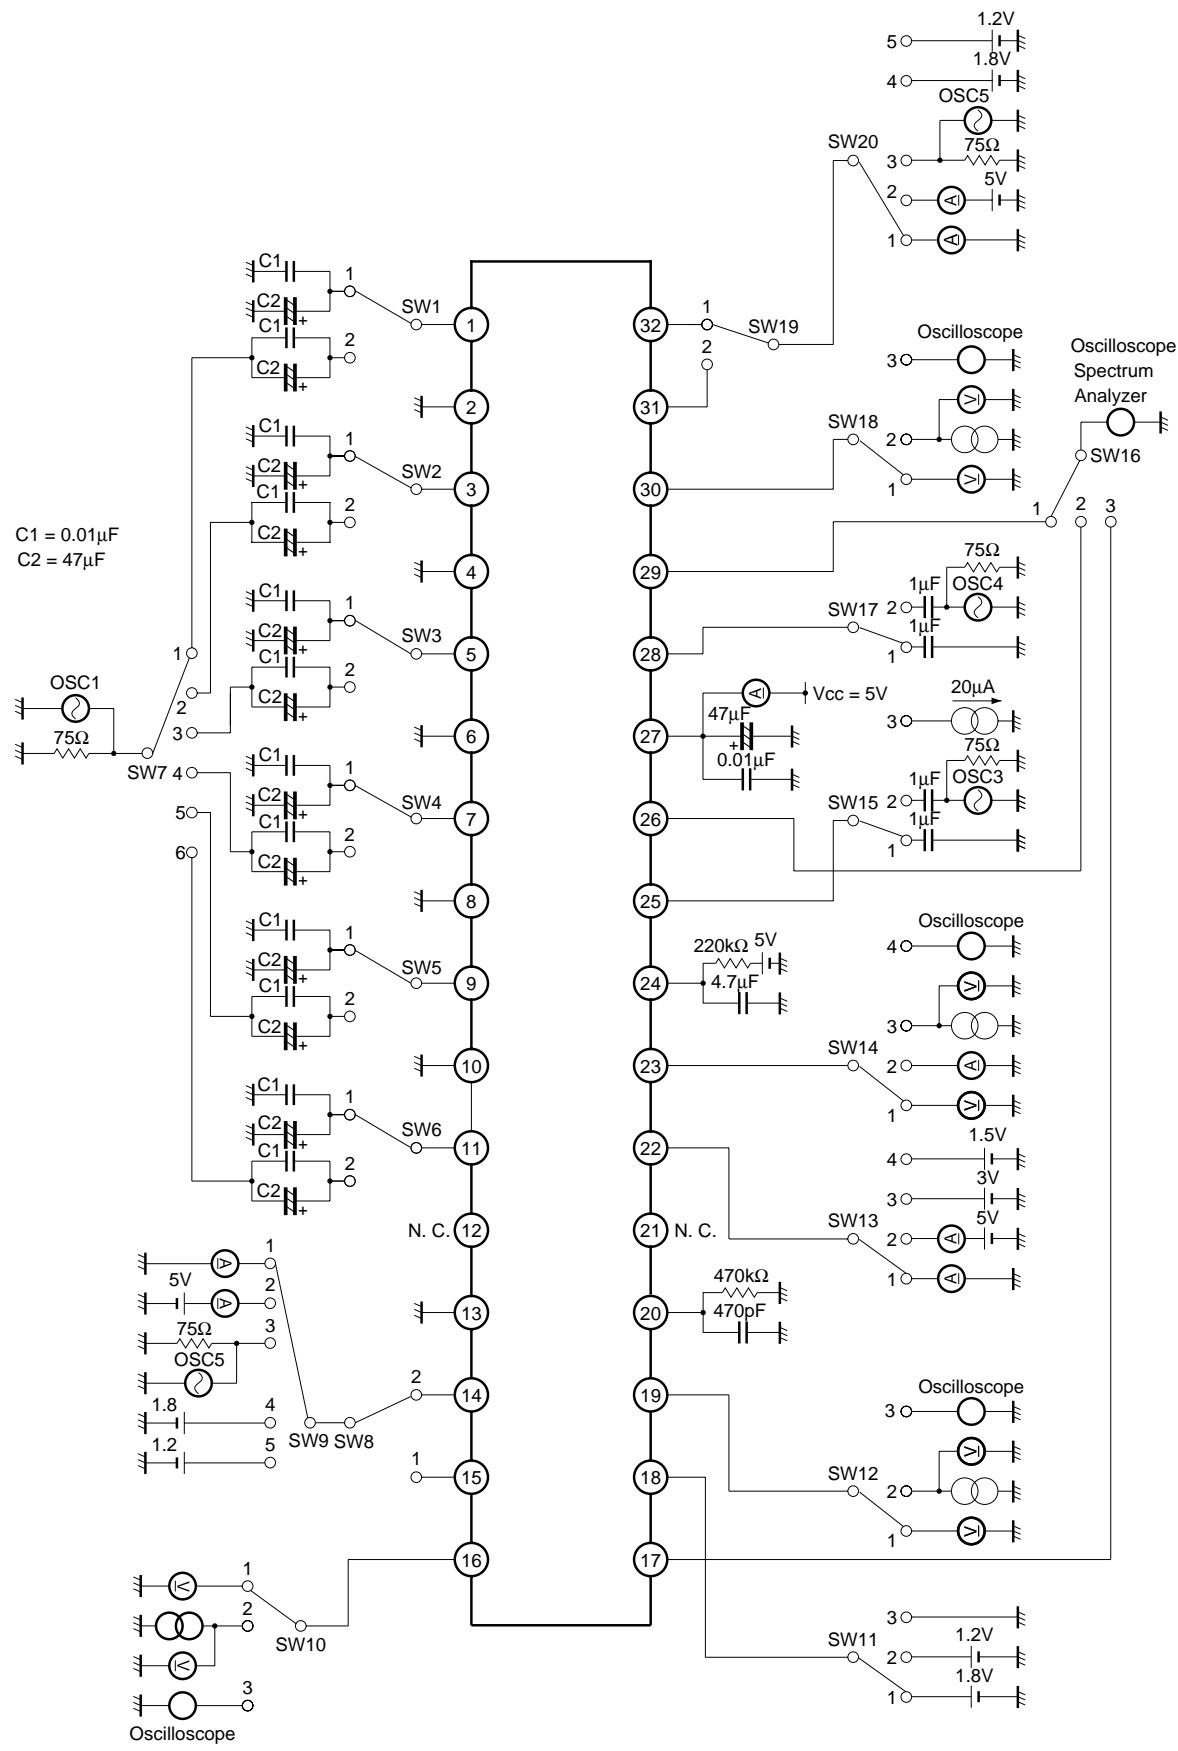

Fig. 1

- Measurement circuit for frequency characteristics and crosstalk characteristics

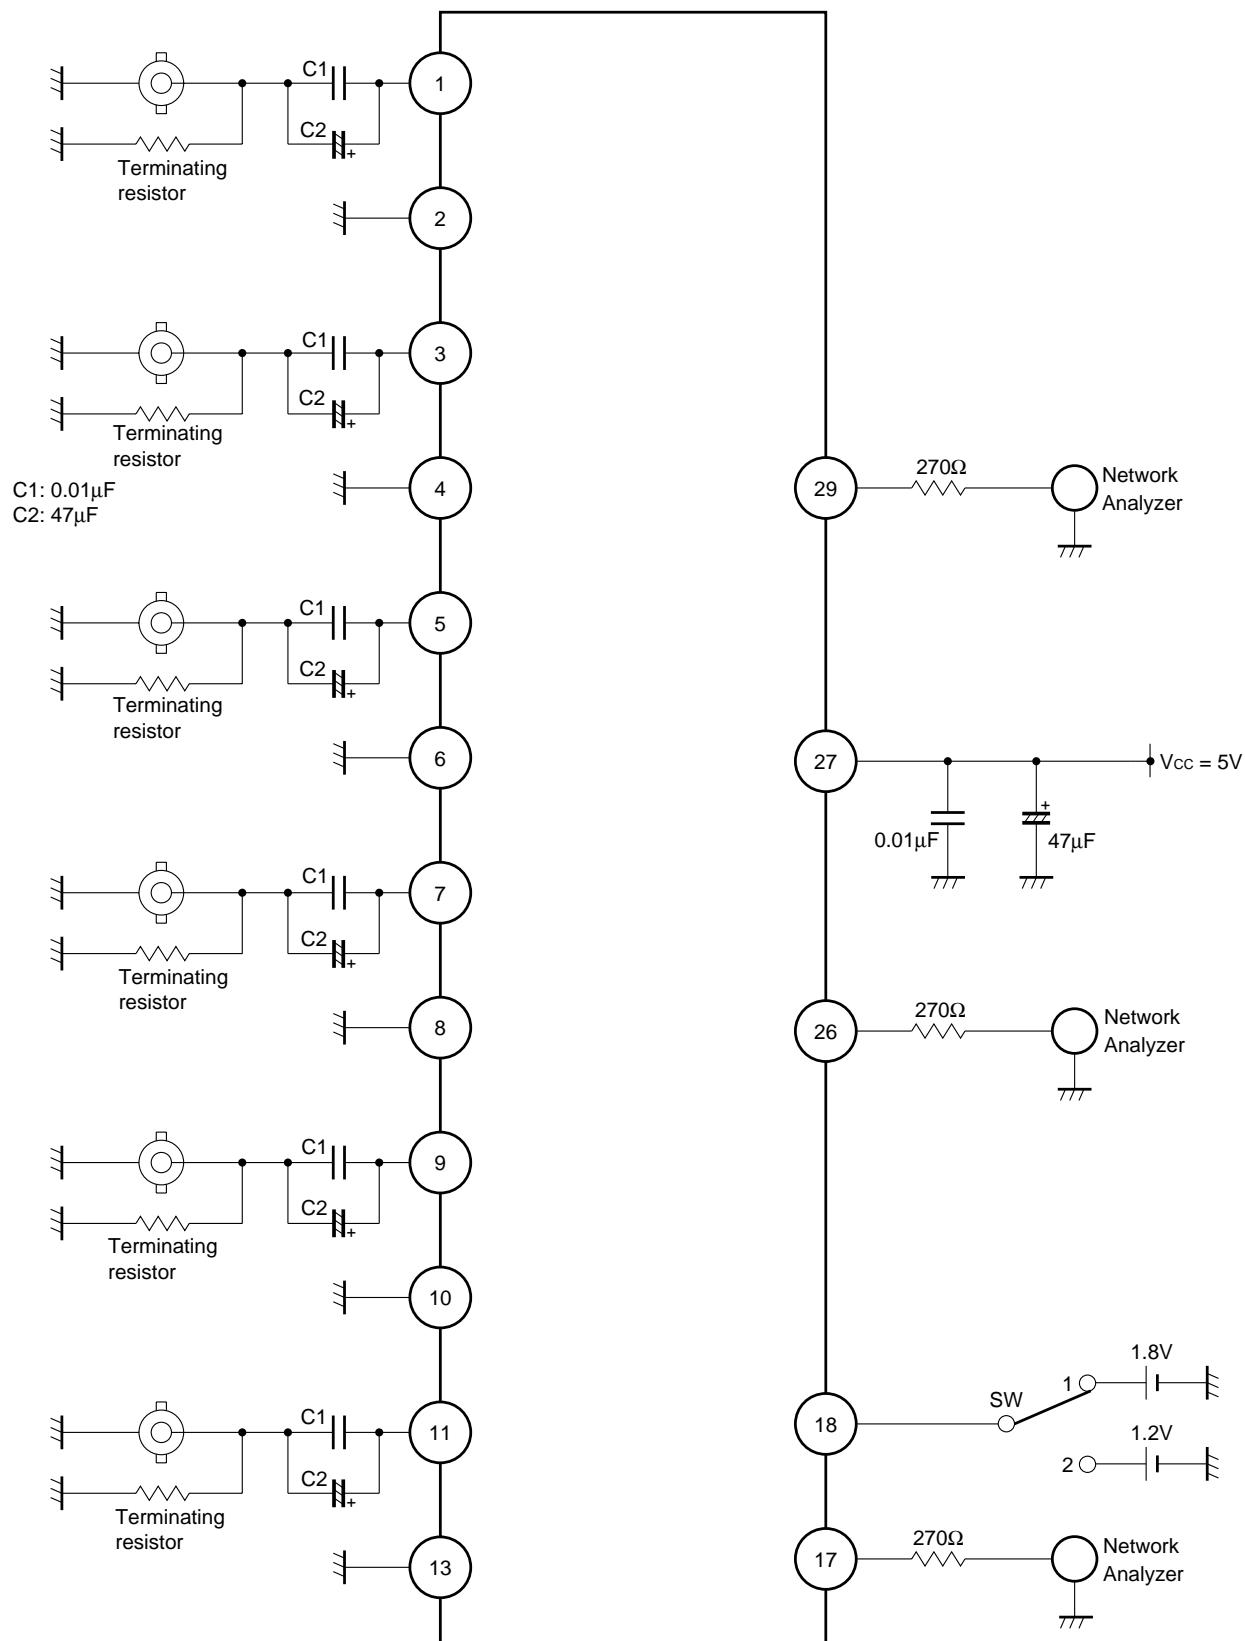

Fig. 2

●Procedure for measurement of frequency characteristics and crosstalk characteristics

(1) Frequency characteristics 1

Use an oscilloscope to input a sine wave ( $V_{IN} = 1.0V_{P-P}$ ,  $f = 1MHz / 150MHz$ ) to the color signal input pins. Set the switch to 1 to select B1, G1 and R1, or to 2 to select B2, G2 and R2.

$$Gf1 = Gv (f = 1MHz) - Gv (150MHz) [dB]$$

(2) Frequency characteristic 2

Use an oscilloscope to input a sine wave ( $V_{IN} = 1.0V_{P-P}$ ,  $f = 1MHz / 230MHz$ ) to the color signal input pins. Set the switch to 1 to select B1, G1 and R1, or to 2 to select B2, G2 and R2.

$$Gf1 = Gv (f = 1MHz) - Gv (250MHz) [dB]$$

(3) Input pin crosstalk 1

Use an oscilloscope to input a sine wave ( $V_{IN} = 1.0V_{P-P}$ ,  $f = 10MHz$ ) to IN1. Connect IN2 to the ground through a capacitor. Set the switch to 2, input to IN2, then measure.

$$CTI1 = 20\log (V_{OUT} / V_{IN}) [dB]$$

(4) Input pin crosstalk 2

Use an oscillator to input a sine wave ( $V_{IN} = 1.0V_{P-P}$ ,  $f = 230MHz$ ) to IN1. Connect IN2 to the ground through a

capacitor. Set the switch to 2, input to IN2, then measure.

$$CTI2 = 20\log (V_{OUT} / V_{IN}) [dB]$$

(5) Block crosstalk 1

Use an oscillator to input a sine wave ( $V_{IN} = 1.0V_{P-P}$ ,  $f = 10MHz$ ) to G1 and R1. Connect B1 to the ground through a capacitor. Set the switch to 1 and measure the B output.

$$CTB1B = 20\log (V_{OUTB} / V_{ING1}) [dB]$$

Similarly,

$$CTB1G = 20\log (V_{OUTG} / V_{INR1}) [dB]$$

$$CTB1R = 20\log (V_{OUTR} / V_{INB1}) [dB]$$

(6) Block crosstalk 2

Use an oscillator to input a sine wave ( $V_{IN} = 1.0V_{P-P}$ ,  $f = 230MHz$ ) to G1 and R1. Connect B1 to the ground through a capacitor. Set the switch to 1 and measure the B output.

$$CTB2B = 20\log (V_{OUTB} / V_{ING1}) [dB]$$

Similarly,

$$CTB2G = 20\log (V_{OUTG} / V_{INR1}) [dB]$$

$$CTB2R = 20\log (V_{OUTR} / V_{INB1}) [dB]$$

●Circuit operation

(1) Analog switches

Switch between the two sets of R, G and B color signals. IN1 is selected by impressing the high level voltage on the CTL pin, IN2 by impressing the low level voltage.

(2) Digital switches

These switch between the two sets of HD and VD synchronization signals. HD and VD synchronization signals for IN1 are output by impressing the high level voltage on the CTL pin, HD and VD synchronization signals for IN2 by impressing the low level voltage.

(3) Synchronization separation block

Outputs the synchronization signals by separating them from composite signals (Sync on Green). When HD signals are being input, the synchronization signal detector stops the synchronization separator. The low

level voltage is output. The time that the synchronization separator is stopped can be set by changing the time constant attached to the synchronization signal detection pin.

(4) Signal detection block

When the signal input exceeds the level set inside the IC (typically 400mV<sub>P-P</sub>, V<sub>CC</sub> = 5.0V), the high level voltage is output to the color signal detection output pin. The low level voltage is output when the signal input is lower than the set level. The quiescent circuit reaction time can be set by changing the time constant attached to pin used to set the time constant for color signal detection. The signal detector stops while the high level is being input to the blanking pulse input pin, thereby preventing malfunctioning due setup signal block during the synchronization signal period.

The relationship between inputs and outputs

Input			Output		
HD	VD	Sync on Green	HD	VD	Composite Sync

● Operation notes

Resistors attached to the analog switch block output

Frequency characteristics of the analog switches vary according to the output load capacity. Set the attached resistor so that frequency characteristics remain flat. A too-large resistance will lower the characteristics peak.
