## Functional Description

The LCX16543 contains sixteen non-inverting transceivers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins may be shorted together to obtain full 16 -bit operation. The following description applies to each byte. For data flow from A to B , for example, the A-to-B Enable ( $\overline{\mathrm{CEAB}}_{\mathrm{n}}$ ) input must be LOW in order to enter data from $A_{0}-A_{15}$ or take data from $B_{0}-B_{15}$, as indicated in the Data I/O Control Table. With $\overline{\mathrm{CEAB}}_{\mathrm{n}}$ LOW, a LOW signal on the A-to-B Latch Enable ( $\left.\overline{\mathrm{LEAB}}_{\mathrm{n}}\right)$ input
makes the A-to-B latches transparent; a subsequent LOW-to-HIGH transition of the $\overline{\mathrm{LEAB}}_{n}$ signal puts the A latches in the storage mode and their outputs no longer change with the $A$ inputs. With $\overline{\mathrm{CEAB}}_{\mathrm{n}}$ and $\overline{\mathrm{OEAB}}_{\mathrm{n}}$ both LOW, the 3-STATE B output buffers are active and reflect the data present at the output of the $A$ latches. Control of data flow from $B$ to $A$ is similar, but using the $\overline{C E B A}_{n}, \overline{L E B A}_{n}$ and $\overline{\mathrm{OEBA}}_{n}$ inputs.

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recom mended Operating Conditions" table will define the conditions for actual device operation
Note 3: $\mathrm{I}_{\mathrm{O}}$ Absolute Maximum Rating must be observed.
Note 4: Unused (inputs or I/Os) must be held HIGH or LOW. They may not float.
