74ALVC162827 Low Voltage 20-Bit Buffer/Line Driver with 3.6V Tolerant Inputs and Outputs and 26Ω Series Resistors in the Outputs

General Description

FAIRCHILD

SEMICONDUCTOR

The ALVC162827 contains twenty non-inverting buffers with 3-STATE outputs to be employed as a memory and address driver, clock driver, or bus oriented transmitter/ receiver. The device is byte controlled. Each byte has NOR output enables for maximum control flexibility.

The 74ALVC162827 is designed for low voltage (1.65V to 3.6V) V_{CC} applications with I/O capability up to 3.6V. The ALVC162827 is also designed with 26Ω resistors in the outputs.

The 74ALVC162827 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

Features

- 1.65V to 3.6V V_{CC} supply operation
- 3.6V tolerant inputs and outputs
- 26Ω series resistors in outputs
- t_{PD}
 - 3.9 ns max for 3.0V to 3.6V V_{CC} 4.6 ns max for 2.3V to 2.7V V_{CC} 8.2 ns max for 1.65V to 1.95V V_{CC}
- Power-off high impedance inputs and outputs

November 2001

Revised November 2001

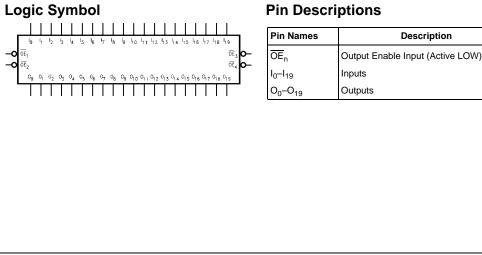

- Supports live insertion and withdrawal (Note 1)
- Uses patented noise/EMI reduction circuitry
- Latchup conforms to JEDEC JED78
- ESD performance:

Human body model > 2000V Machine model > 200V

Note 1: To ensure the high-impedance state during power up or power down, $\overline{\text{OE}}$ should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

Ordering Code:

Order Number	Package Number	Package Description				
74ALVC162827T	MTD56	56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide				
Devices also available in Tape and Reel. Specify by appending the suffix "X" to the ordering code.

Functional Description

The 74ALVC162827 contains twenty non-inverting buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of each other. The control pins may be shorted together to obtain full 20-bit operation. The 3-STATE outputs are controlled by Output Enable (\overline{OE}_n) inputs. When \overline{OE}_1 , and \overline{OE}_2 are LOW, $O_0 - O_{10}$ are in the 2-state mode. When either \overline{OE}_1 or $\overline{\text{OE}}_2$ are HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs. The same applies for byte two with $\overline{\mathsf{OE}}_3$ and $\overline{\mathsf{OE}}_4$.

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: I_O Absolute Maximum Rating must be observed.

Note 4: Floating or unused control inputs must be held HIGH or LOW.
