Product Description

Pericom Semiconductor's PI74AVC+ series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading speed.

The PI74AVC+16345 is ideal for driving memory modules in systems where multiple memory modules are used. One each of the four output banks drive a different module; modules can be added or removed without affecting the signal integrity of the other modules in the system. Dual clock enables ($\overline{CE}x$) allow use of the device in high-speed memory interleaving applications where the clock can be alternately enabled and disabled, allowing the address to be held for additional cycles during memory access.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current sinking capability of the driver.
