## Functional Description

The LCX821 consists of ten edge-triggered flip-flops with individual D-type inputs with 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The ten flip-flops will store the state of their individual $D$ inputs that meet the setup and hold time
requirements on the LOW-to-HIGH Clock (CLK) transition. With the Output Enable ( $\overline{\mathrm{OE})}$ LOW, the contents of the ten flip-flops are available at the outputs. When OE is HIGH, the outputs go to the high impedance state. Operation of the OE input does not affect the state of the flip-flops.

Note 2：The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed．The device should not be operated at these limits．The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings．The＂Recom－ mended Operating Conditions＂table will define the conditions for actual device operation．
Note 3： $\mathrm{I}_{\mathrm{O}}$ Absolute Maximum Rating must be observed．
Note 4：Unused inputs must be held HIGH or LOW．They may not float．
