Functional Description
The LCX16821 contains twenty D-type flip-flops with 3STATE standard outputs. The device is byte controlled with each byte functioning identically, but independent of the other. Control pins can be shorted together to obtain full 20-bit operation. The following description applies to each byte. The twenty flip-flops will store the state of their individual $D$ inputs that meet the setup and hold time require-

H = HIGH Voltage Level
L = LOW Voltage Level
X = Immaterial
$Z=$ High Impedance
$\mathrm{O}_{0}=$ Previous $\mathrm{O}_{0}$ before LOW-to-HIGH transition of Clock
= LOW-to-HIGH transition
ments on the LOW-to-HIGH Clock (CLK) transition. The 3STATE standard outputs are controlled by the Output Enable $\left(\mathrm{OE}_{\mathrm{n}}\right)$ input. When $\mathrm{OE}_{\mathrm{n}}$ is LOW, the standard outputs are in the 2-state mode. When $\overline{\mathrm{OE}}_{\mathrm{n}}$ is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the flip-flops.

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
Note 3: $\mathrm{I}_{\mathrm{O}}$ Absolute Maximum Rating must be observed.
Note 4: Unused pins (Inputs and I/O) must be held HIGH or LOW. They may not float.
