# 74F564 Octal D-Type Flip-Flop with 3-STATE Outputs

#### **General Description**

The 74F564 is a high-speed, low power octal flip-flop with a buffered common Clock (CP) and a buffered common Output Enable ( $\overline{\text{OE}}$ ). The information presented to the D inputs is sorted in the flip-flops on the LOW-to-HIGH Clock (CP) transition.

This device is functionally identical to the 74F574, but has inverted outputs.

## Features

#### **Functional Description**

The 74F564 consists of eight edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The eight flip-flops will store the state of their individual D inputs that meet the setup and hold times requirements on the LOW-to-HIGH Clock (CP) transition. With the Output Enable ( $\overline{OE}$ ) LOW, the contents of the eight flip-flops are available at the outputs. When  $\overline{OE}$  is HIGH, the outputs go to the high impedance state. Operation of the  $\overline{OE}$  input does not affect the state of the flip-flops.
