- Available in QSOP and TSSOP packages

DESCRIPTION:

The CBTLV3253 is a dual 1-of-4 high-speed multiplexer/demultiplexer. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The select (S0, S1) input controls the data flow. The multiplexer/demultiplexer switches are disabled when the output-enable (\overline{OE}) input is high.

To ensure that the device is in high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

			$I_O = 24\text{mA}$	—	5	7	
		$V_I = 2.4\text{V}$	$I_O = 15\text{mA}$	—	10	15	

NOTES:

1. Typical values are at $V_{CC} = 3.3\text{V}$, $+25^{\circ}\text{C}$ ambient.
2. The increase in supply current is attributable to each current that is at the specified voltage level rather than V_{CC} or GND.
3. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.
