Precision Edge®

**DESCRIPTION**

The SY89327L is a fully differential, high-speed translator optimized to accept any logic standard from single-ended TTL/CMOS to differential LVDS, HSTL, or CML and translate it to LVPECL. Translation is guaranteed for speeds up to 2.5Gbps (2.5GHz toggle frequency). The SY89327L does not internally terminate its inputs because different interfacing standards have different termination requirements.

The SY89327L is a member of Micrel's Precision Edge® family of high-speed logic devices. This family features ultra-small packaging, as well as high signal integrity and operation at many different supply voltages.

All support documentation can be found on Micrel's web site at [www.micrel.com](http://www.micrel.com).

**PIN DESCRIPTION**

Pin Number	Pin Name	Pin Function
2, 3	IN, /IN	Differential inputs: This input is the differential signal input to the device. This input accepts AC- or DC-coupled signals as small as 100mV. External termination is required. Please refer to the “Input Interface Applications” section for more details.
8	VCC	Positive power supply. Bypass with 0.1µF    0.01µF low ESR capacitors.
7, 6	Q, /Q	Differential LVPECL Output: Terminate with 50Ω to V <sub>CC</sub> -2V. See “Output Interface Applications” section. Output pair is 100k temperature compensated LVPECL compatible.
5	GND, Exposed Pad	Ground: Ground pin and exposed pad must be connected to the same ground plane.
1, 4	NC	No connect.

**FUNCTIONAL DESCRIPTION**

**Establishing Static Logic Inputs**

Do not leave unused inputs floating. Tie either the true or complement input to ground. A logic zero is achieved by connecting the complement input to ground with the true input floating. For a TTL input, tie a 2.5kΩ resistor between the complement input and ground. See “Input Interface” section.

**Input Levels**

LVDS, CML, and HSTL differential signals may be connected directly to the D inputs. Depending on the actual worst case voltage seen, the SY8327L's performance varies as per the following table:

Input Voltage Range	Minimum Voltage Swing	Maximum Translation Speed
0 to 2.4V	100mV	2.5Gbps
0 to V <sub>CC</sub> +0.3V	200mV	1.25Gbps

For LVDS applications, only point-to-point interfaces are supported. Due to the current required by the input structure shown in Figure 1, multi-drop and multi-point architectures are not supported.

**Notes:**

1. Permanent device damage may occur if the "Absolute Maximum Ratings" are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package Thermal Resistance assumes exposed pad is soldered (or equivalent) to the devices' most negative potential on the PCB.  $\Psi_{JB}$  uses 4-layer  $\theta_{JA}$  in still-air unless otherwise stated.
4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.

**Notes:**

- See "Timing Diagrams" section for definition of parameters. High frequency AC-parameters are guaranteed by design and characterization.
- RJ is measured with a K28.7 comma detect character pattern, measured at  $f_{MAX}$ .
- DJ is measured at 2.5Gbps, with both K28.5 and 2<sup>23</sup>-1 PRBS pattern.
- Total jitter definition: with an ideal clock input of frequency  $\leq f_{MAX}$ , no more than one output edge in 10<sup>12</sup> output edges will deviate by more than the specified peak-to-peak jitter value.
