

NLSX4014

4-Bit 100 Mb/s Configurable Dual-Supply Level Translator

The NLSX4014 is a 4-bit configurable dual-supply bidirectional level translator without a direction control pin. The I/O V_{CC-} and I/O V_L -ports are designed to track two different power supply rails, V_{CC} and V_L respectively. The V_{CC} supply rail is configurable from 1.3 V to 4.5 V while the V_L supply rail is configurable from 0.9 V to ($V_{CC} - 0.4$) V. This allows lower voltage logic signals on the V_L side to be translated into higher voltage logic signals on the V_{CC} side, and vice-versa. Both I/O ports are auto-sensing; thus, no direction pin is required.

The Output Enable (EN) input, when Low, disables both I/O ports by putting them in 3-state. This significantly reduces the supply currents from both V_{CC} and V_L . The EN signal is designed to track V_L .

Features

- Wide High-Side V_{CC} Operating Range: 1.3 V to 4.5 V
Wide Low-Side V_L Operating Range: 0.9 V to ($V_{CC} - 0.4$) V
- Power Supply Isolation
 - ◆ All Outputs are in the High Impedance State if Either V_L or V_{CC} is at Ground
- High-Speed with 100 Mb/s Guaranteed Data Rate for $V_L > 1.6$ V
- Low Bit-to-Bit Skew
- Overvoltage Tolerant Enable and I/O Pins
- Non-preferential Powerup Sequencing
- Small packaging: 1.7 mm x 2.0 mm UQFN12
- These are Pb-Free Devices

Typical Applications

- Mobile Phones, PDAs, Other Portable Devices

ON Semiconductor®

1. Normal test conditions are V_{EN} = 0 V, C_{I0VCC} = 15 pF and C_{I0VL} = 15 pF, unless otherwise specified.
2. V_{CC} is the supply voltage associated with the high voltage port, and V_{CC} ranges from +1.3 V to 4.5 V under normal operating conditions.
3. V_L is the supply voltage associated with the low voltage port. V_L must be less than or equal to (V_{CC} - 0.4) V during normal operation. However, during startup and shutdown conditions, V_L can be greater than (V_{CC} - 0.4) V.
4. Typical values are for V_{CC} = +2.8 V, V_L = +1.8 V and T_A = +25°C. All units are production tested at T_A = +25°C. Limits over the operating temperature range are guaranteed by design.

IMPORTANT APPLICATIONS INFORMATION

Level Translator Architecture

The NLSX4014 auto sense translator provides bi-directional voltage level shifting to transfer data in multiple supply voltage systems. This device has two supply voltages, V_L and V_{CC} , which set the logic levels on the input and output sides of the translator. When used to transfer data from the V_L to the V_{CC} ports, input signals referenced to the V_L supply are translated to output signals with a logic level matched to V_{CC} . In a similar manner, the V_{CC} to V_L translation shifts input signals with a logic level compatible to V_{CC} to an output signal matched to V_L .

The NLSX4014 consists of four bi-directional channels that independently determine the direction of the data flow without requiring a directional pin. The one-shot circuits are used to detect the rising or falling input signals. In addition, the one shots decrease the rise and fall time of the output signal for high-to-low and low-to-high transitions.

Input Driver Requirements

For proper operation, the input driver to the auto sense translator should be capable of driving 2.0 mA of peak output current.

Output Load Requirements

The NLSX4014 is designed to drive CMOS inputs. Resistive pullup or pulldown loads of less than 50 k Ω should not be used with this device. The NLSX3373 or NLSX3378 open-drain auto sense translators are alternate translator options for an application such as the I²C bus that requires pullup resistors.

Enable Input (EN)

The NLSX4014 has an Enable pin (EN) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O V_{CC} and I/O V_L pins to a high impedance state. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin is referenced to the V_L supply and has Over-Voltage Tolerant (OVT) protection.

Uni-Directional versus Bi-Directional Translation

The NLSX4014 can function as a non-inverting uni-directional translator. One advantage of using the translator as a uni-directional device is that each I/O pin can be configured as either an input or output. The configurable input or output feature is especially useful in applications such as SPI that use multiple uni-directional I/O lines to send data to and from a device. The flexible I/O port of the auto sense translator simplifies the trace connections on the PCB.

Power Supply Guidelines

It is recommended that the V_L supply should be less than or equal to the value of the V_{CC} minus 0.4 V. The sequencing of the power supplies will not damage the device during the power up operation; however, the current consumption of the device will increase if V_L exceeds V_{CC} minus 0.4 V. In addition, the I/O V_{CC} and I/O V_L pins are in the high impedance state if either supply voltage is equal to 0 V.

For optimal performance, 0.01 to 0.1 μ F decoupling capacitors should be used on the V_L and V_{CC} power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the power supply voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.

The NLSX4014 provides power supply isolation if either supply voltage V_L or V_{CC} is equal to 0 V. The isolation occurs because the I/O pins are in the high impedance state. It is recommended that pulldown resistors should be used if the V_L or V_{CC} are floated or in a high impedance state. A pulldown resistor connected from the supply voltage to ground ensures that the translator's supply voltage is equal to 0 V.

SOLDERING FOOTPRINT

ON Semiconductor and are registered trademarks of Semiconductor Components Industries, LLC (SCILLC). SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
