## 74VCXR162601 Low Voltage 18-Bit Universal Bus Transceivers with 3.6V Tolerant Inputs and Outputs and 26 $\Omega$ Series Resistors in the Outputs

### **General Description**

The VCXR162601, 18-bit universal bus transceiver, combines D-type latches and D-type flip-flops to allow data flow in transparent, latched, and clocked modes.

Data flow in each direction is controlled by output-enable (OEAB and OEBA), latch-enable (LEAB and LEBA), and clock (CLKAB and CLKBA) inputs. The clock <u>can be con</u>trolled by the clock-enable (CLKENAB and CLKENBA) inputs. For A-to-B data flow, the device operates in the transparent mode when LEAB is HIGH. When LEAB is LOW, the A data is latched if CLKAB is held at a HIGH-to-LOW logic level. If LEAB is LOW, the A bus data is stored in the latch/flip-flop on the LOW-to-HIGH transition of CLKAB. Output-enable OEAB is active-LOW. When OEAB is HIGH, the outputs are in the high-impedance state.

 $\frac{\text{Data flow for B to A is similar to that of A to B but uses}{\overline{\text{OEBA}}, \text{LEBA}, \text{CLKBA and }\overline{\text{CLKENBA}}.$ 

The 74VCXR162601 is designed for low voltage (1.4V to 3.6V) V<sub>CC</sub> applications with I/O compatibility up to 3.6V. The VCXR162601 is also designed with 26 $\Omega$  series resistors on both the A and B Port outputs. This design reduces line noise in applications such as memory address drivers, clock drivers, and bus transceivers/transmitters.

#### Features

- 1.4V to 3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant inputs and outputs
- **Ξ** 26 $\Omega$  series resistors on both the A and B Port outputs.

August 1998

Revised October 2004

- t<sub>PD</sub> (A to B, B to A)
  - 3.8 ns max for 3.0V to 3.6V  $V_{CC}$
- Power-down HIGH impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- Static Drive (I<sub>OH</sub>/I<sub>OL</sub>)
  - ±12 mA @ 3.0V V<sub>CC</sub>
- Uses patented noise/EMI reduction circuitry
- Latchup performance exceeds 300 mA
- ESD performance:

Human body model > 2000V Machine model >200V

Note 1: To ensure the high-impedance state during power up or power down,  $\overline{\text{OE}}$  should be tied to  $V_{\text{CC}}$  through a pull-up resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

Note 5: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The Recommended Operating Conditions tables will define the conditions for actual device operation.

Note 6:  $\mathrm{I}_{\mathrm{O}}$  Absolute Maximum Rating must be observed.

Note 7: Floating or unused pin (inputs or I/O's) must be held HIGH or LOW.
