Functional Description^[1]

The CY62167E is a high performance CMOS static RAM organized as 1 M words by 16-bits/2 M words by 8-bits. This device features advanced circuit design to provide an ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that

reduces power consumption by 99% when addresses are not toggling. Place the device into standby mode when deselected (\overline{CE}_1 HIGH, or CE_2 LOW, or both \overline{BHE} and \overline{BLE} are HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when:

- The device is deselected (\overline{CE}_1 HIGH or CE_2 LOW)
- Outputs are disabled (\overline{OE} HIGH)
- Both byte high enable and byte low enable are disabled (\overline{BHE} , \overline{BLE} HIGH) or
- A write operation is in progress (\overline{CE}_1 LOW, CE_2 HIGH, and \overline{WE} LOW)

To write to the device, take chip enables (\overline{CE}_1 LOW and CE_2 HIGH) and write enable (\overline{WE}) input LOW. If byte low enable (\overline{BLE}) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{19}). If byte high enable (\overline{BHE}) is LOW, then data from the I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{19}).

To read from the device, take chip enables (\overline{CE}_1 LOW and CE_2 HIGH) and output enable (\overline{OE}) LOW while forcing the write enable (\overline{WE}) HIGH. If byte low enable (\overline{BLE}) is LOW, then data from the memory location specified by the address pins appears on I/O_0 to I/O_7 . If byte high enable (\overline{BHE}) is LOW, then data from memory appears on I/O_8 to I/O_{15} . See the “Truth Table” on page 11 for a complete description of read and write modes.

Notes

- NC pins are not connected on the die.
- The BYTE pin in the 48-TSOP package must be tied to V_{CC} to use the device as a 1 M × 16 SRAM. The 48-TSOP package can also be used as a 2 M × 8 SRAM by tying the BYTE signal to V_{SS}. In the 2 M × 8 configuration, pin 45 is A20, while BHE, BLE and I/O₈ to I/O₁₄ pins are not used.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC}(typ), T_A = 25 °C.

Notes

- V_{IL}(min) = -2.0 V for pulse durations less than 20 ns.
- V_{IH}(max) = V_{CC} + 0.75 V for pulse durations less than 20 ns.

- Chip enables (\overline{CE}_1 and CE₂), byte enables (BHE and BLE) and BYTE need to be tied to CMOS levels to meet the I_{SB2} / I_{CDDR} spec. Other inputs can be left floating.
- Tested initially and after any design or process changes that may affect these parameters.

Notes

17. Test conditions for all parameters other than tristate parameters assume signal transition time of 1 V/ns, timing reference levels of $V_{CC}(typ)/2$, input pulse levels of 0 to $V_{CC}(typ)$, and output loading of the specified I_{OL}/I_{OH} as shown in "AC Test Loads and Waveforms" on page 5.
18. AC timing parameters are subject to byte enable signals (BHE or BLE) not switching when chip is disabled. See application note AN13842 for further clarification.
19. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
20. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
21. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} or \overline{BLE} or both = V_{IL} , and $CE_2 = V_{IH}$. All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.
26. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
27. If \overline{CE}_1 goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
