

### FEATURES

#### Enhanced product features

- Supports defense and aerospace applications (AQEC)
- Military temperature range ( $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ )
- Controlled manufacturing baseline
- One assembly/test site
- One fabrication site
- Enhanced product change notification
- Qualification data available on request

#### 4 buffered 12-Bit DACs in 10-lead MSOP

- S Version:  $\pm 10$  LSB INL
- Low power operation: 500  $\mu\text{A}$  @ 3 V, 600  $\mu\text{A}$  @ 5 V
- 2.5 V to 5.5 V power supply
- Guaranteed monotonic by design over all codes
- Power-down to 80 nA @ 3 V, 200 nA @ 5 V
- Double-buffered input logic
- Output range: 0 V to  $V_{\text{REF}}$
- Power-on reset to 0 V
- Simultaneous update of outputs (LDAC function)
- On-chip, rail-to-rail output buffer amplifiers
- Temperature range  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

### APPLICATIONS

- Portable battery-powered instruments
- Digital gain and offset adjustment
- Programmable voltage and current sources
- Programmable attenuators
- Industrial process control

### GENERAL DESCRIPTION

The AD5324-EP<sup>1</sup> is a quad 12-bit buffered voltage output DAC in a 10-lead MSOP package that operates from a single 2.5 V to 5.5 V supply, consuming 500  $\mu\text{A}$  at 3 V. Its on-chip output amplifiers allows rail-to-rail output swing to be achieved with a slew rate of 0.7 V/ $\mu\text{s}$ . A 3-wire serial interface is used; it operates at clock rates up to 30 MHz and is compatible with standard SPI, QSPI™, MICROWIRE™, and DSP interface standards.

The references for the four DACs are derived from one reference pin. The outputs of all DACs can be updated simultaneously using the software LDAC function. The part incorporates a power-on reset circuit, and ensures that the DAC outputs power up to 0 V and remains there until a valid write takes place to the device. The part contains a power-down feature that reduces the current consumption of the device to 200 nA at 5 V (80 nA at 3 V).

The low power consumption of this part in normal operation makes it ideally suited to portable battery-operated equipment. The power consumption is 3 mW at 5 V, and 1.5 mW at 3 V, reducing to 1  $\mu\text{W}$  in power-down mode.

Full details about this enhanced product are available in the [AD5324](#) data sheet, which should be consulted in conjunction with this data sheet.

<sup>1</sup> DC specifications tested with the outputs unloaded.

<sup>2</sup> Linearity is tested using a reduced code range: Code 115 to Code 3981.

<sup>3</sup> Guaranteed by design and characterization, not production tested.

<sup>4</sup> For the amplifier output to reach its minimum voltage, offset error must be negative. For the amplifier output to reach its maximum voltage,  $V_{REF} = V_{DD}$  and offset plus gain error must be positive.

<sup>5</sup>  $I_{DD}$  specification is valid for all DAC codes; interface inactive; all DACs active; load currents excluded.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. MSOP Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	$V_{DD}$	Power Supply Input. This part can be operated from 2.5 V to 5.5 V and the supply can be decoupled to GND.
2	$V_{OUTA}$	Buffered Analog Output Voltage from DAC A. The output amplifier has rail-to-rail operation.
3	$V_{OUTB}$	Buffered Analog Output Voltage from DAC B. The output amplifier has rail-to-rail operation.
4	$V_{OUTC}$	Buffered Analog Output Voltage from DAC C. The output amplifier has rail-to-rail operation.
5	REFIN	Reference Input Pin for All Four DACs. It has an input range from 0.25 V to $V_{DD}$ .
6	$V_{OUTD}$	Buffered Analog Output Voltage from DAC D. The output amplifier has rail-to-rail operation.
7	GND	Ground Reference Point for All Circuitry on the Part.
8	DIN	Serial Data Input. This device has a 16-bit shift register. Data is clocked into the register on the falling edge of the serial clock input. The DIN input buffer is powered down after each write cycle.
9	SCLK	Serial Clock Input. Data is clocked into the input shift register on the falling edge of the serial clock input. Data can be transferred at clock speeds up to 30 MHz. The SCLK input buffer is powered down after each write cycle.
10	$\overline{\text{SYNC}}$	Active Low Control Input. This is the frame synchronization signal for the input data. When $\overline{\text{SYNC}}$ goes low, it enables the input shift register and data is transferred in on the falling edges of the following 16 clocks. If $\overline{\text{SYNC}}$ is taken high before the 16 <sup>th</sup> falling edge of SCLK, the rising edge of $\overline{\text{SYNC}}$ acts as an interrupt and the write sequence is ignored by the device.
