## FEATURES

RS-485 transceiver with electrical data isolation Complies with ANSI TIA/EIA RS-485-A and ISO 8482: 1987(E)
500 kbps data rate

## Slew rate-limited driver outputs

Low power operation: $\mathbf{2 . 5} \mathbf{~ m A}$ max
Suitable for 5 V or 3 V operations (VDD1)
High common-mode transient immunity: > $\mathbf{2 5} \mathbf{k V} / \boldsymbol{\mu s}$
True fail-safe receiver inputs
Chatter-free power-up/power-down protection
256 nodes on bus
Thermal shutdown protection
Safety and regulatory approvals
UL recognition: $\mathbf{2 5 0 0}$ V $_{\text {rms }}$ for 1 minute per UL 1577
CSA Component Acceptance Notice \#5A
VDE Certificate of Conformity
DIN EN 60747-5-2 (VDE 0884 Rev. 2): 2003-01
DIN EN 60950 (VDE 0805): 2001-12; EN 60950: 2000
$\mathrm{V}_{\text {IORM }}=560 \mathrm{~V}$ peak
Operating temperature range: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

## APPLICATIONS

Low power RS-485/RS-422 networks
Isolated interfaces
Building control networks
Multipoint data transmission systems

## GENERAL DESCRIPTION

The ADM2483 differential bus transceiver is an integrated, galvanically isolated component designed for bidirectional data communication on balanced, multipoint bus transmission lines. It complies with ANSI EIA/TIA-485-A and ISO 8482: 1987(E). Using Analog Devices' iCoupler technology, the ADM2483 combines a 3-channel isolator, a three-state differential line driver, and a differential input receiver into a single package. The logic side of the device is powered with either a 5 V or 3 V supply, and the bus side uses a 5 V supply only.

The ADM2483 is slew-limited to reduce reflections with improperly terminated transmission lines. The controlled slew rate limits the data rate to 500 kbps . The device's input impedance is $96 \mathrm{k} \Omega$, allowing up to 256 transceivers on the bus. Its driver has an active-high enable feature. The driver differential outputs

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.
and receiver differential inputs are connected internally to form a differential I/O port. When the driver is disabled or when $\mathrm{V}_{\mathrm{DD} 1}$ or $\mathrm{V}_{\mathrm{DD} 2}=0 \mathrm{~V}$, this imposes minimal loading on the bus. An active-high receiver disable feature, which causes the receive output to enter a high impedance state, is provided as well.

The receiver inputs have a true fail-safe feature that ensures a logic-high receiver output level when the inputs are open or shorted. This guarantees that the receiver outputs are in a known state before communication begins and at the point when communication ends.

Current limiting and thermal shutdown features protect against output short circuits and bus contention situations that might cause excessive power dissipation. The part is fully specified over the industrial temperature range and is available in a 16-lead, wide body SOIC package.

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted. All voltages are relative to their respective ground.
Table 3.

| Parameter | Rating |
| :---: | :---: |
| VD1 | -0.5 V to +7 V |
| $\mathrm{V}_{\mathrm{DD} 2}$ | -0.5 V to +6 V |
| Digital Input Voltage ( $\mathrm{DE}, \overline{\mathrm{RE}}, \mathrm{TxD}$ ) | -0.5 V to $\mathrm{V}_{\mathrm{DD} 1}+0.5 \mathrm{~V}$ |
| Digital Output Voltage RxD | -0.5 V to $\mathrm{V}_{\mathrm{DD} 1}+0.5 \mathrm{~V}$ |
| Driver Output/Receiver Input Voltage | -9 V to +14V |
| ESD Rating: Contact (Human Body Model) (A, B Pins) | $\pm 2 \mathrm{kV}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Average Output Current per Pin | -35 mA to +35 mA |
| $\theta_{\mathrm{JA}}$ Thermal Impedance | $73^{\circ} \mathrm{C} / \mathrm{W}$ |
| Lead Temperature |  |
| Soldering (10 sec) | $260^{\circ} \mathrm{C}$ |
| Vapor Phase (60 sec) | $215^{\circ} \mathrm{C}$ |
| Infrared (15 sec) | $220^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## CIRCUIT DESCRIPTION

## ELECTRICAL ISOLATION

In the ADM2483, electrical isolation is implemented on the logic side of the interface. Therefore, the part has two main sections: a digital isolation section and a transceiver section (see Figure 26). Driver input and data enable signals, applied to the TxD and DE pins, respectively, and referenced to logic ground $\left(\mathrm{GND}_{1}\right)$, are coupled across an isolation barrier to appear at the transceiver section referenced to isolated ground $\left(\mathrm{GND}_{2}\right)$. Similarly, the receiver output, referenced to isolated ground in the transceiver section, is coupled across the isolation barrier to appear at the RxD pin referenced to logic ground.

## iCoupler Technology

The digital signals are transmitted across the isolation barrier using iCoupler technology. This technique uses chip-scale transformer windings to couple the digital signals magnetically from one side of the barrier to the other. Digital inputs are encoded into waveforms that are capable of exciting the primary transformer winding. At the secondary winding, the induced waveforms are then decoded into the binary value that was originally transmitted.

Figure 26. ADM2483 Digital Isolation and Transceiver Sections

## TRUTH TABLES

The following truth tables use these abbreviations:

| Letter | Description |
| :--- | :--- |
| H | High level |
| L | Low level |
| X | Irrelevant |
| Z | High impedance (off) |
| NC | Disconnected |

Table 9. Transmitting

| Supply Status |  | Inputs |  | Outputs |  |

## POWER-UP/POWER-DOWN CHARACTERISTICS

The power-up/power-down characteristics of the ADM2483 are in accordance with the supply thresholds shown in Table 11. Upon power-up, the ADM2483 output signals (A, B, and RxD) reach their correct state once both supplies exceed their thresholds. Upon power-down, the ADM2483 output signals retain their correct state until at least one of the supplies drops below its power-down threshold. When the $\mathrm{V}_{\text {DDI }}$ power-down threshold is crossed, the ADM2483 output signals reach their unpowered states within $4 \mu$ s.
Table 11. Power-Up/Power-Down Thresholds

| Supply | Transition | Threshold (V) |
| :--- | :--- | :--- |
| $V_{\mathrm{DD} 1}$ | Power-up | 2.0 |
| $V_{\mathrm{DD} 1}$ | Power-down | 1.0 |
| $\mathrm{~V}_{\mathrm{DD} 2}$ | Power-up | 3.3 |
| $\mathrm{~V}_{\mathrm{DD} 2}$ | Power-down | 2.4 |

## THERMAL SHUTDOWN

The ADM2483 contains thermal shutdown circuitry that protects the part from excessive power dissipation during fault conditions. Shorting the driver outputs to a low impedance source can result in high driver currents. The thermal sensing circuitry detects the increase in die temperature under this condition and disables the driver outputs. This circuitry is designed to disable the driver outputs when a die temperature of $150^{\circ} \mathrm{C}$ is reached. As the device cools, the drivers are re-enabled at a temperature of $140^{\circ} \mathrm{C}$.

## TRUE FAIL-SAFE RECEIVER INPUTS

The receiver inputs have a true fail-safe feature, which ensures that the receiver output is high when the inputs are open or shorted. During line-idle conditions, when no driver on the bus is enabled, the voltage across a terminating resistance at the receiver input decays to 0 V . With traditional transceivers, receiver input thresholds specified between -200 mV and +200 mV mean that external bias resistors are required on the $A$ and $B$ pins to ensure that the receiver outputs are in a known state. The true fail-safe receiver input feature eliminates the need for bias resistors by specifying the receiver input threshold between -30 mV and -200 mV . The guaranteed negative threshold means that when the voltage between A and B decays to 0 V , the receiver output is guaranteed to be high.

## MAGNETIC FIELD IMMUNITY

Because $i$ Couplers use a coreless technology, no magnetic components are present, and the problem of magnetic saturation of the core material does not exist. Therefore, $i$ Couplers have essentially infinite dc field immunity. The analysis that follows defines the conditions under which this might occur. The ADM2483's 3 V operating condition is examined because it represents the most susceptible mode of operation.

The limitation on the $i$ Coupler's ac magnetic field immunity is set by the condition in which the induced error voltage in the receiving coil (the bottom coil in this case) is made sufficiently large, either to falsely set or reset the decoder. The voltage induced across the bottom coil is given by

$$
V=\left(\frac{-d \beta}{d t}\right) \sum \pi r_{n}^{2} ; n=1,2, \ldots, N
$$

where if the pulses at the transformer output are greater than 1.0 V in amplitude:
$\beta=$ magnetic flux density (gauss)
$N=$ number of turns in receiving coil
$r_{n}=$ radius of nth turn in receiving coil ( cm )
The decoder has a sensing threshold of about 0.5 V ; therefore, there is a 0.5 V margin in which induced voltages can be tolerated.

## ADM2483

Given the geometry of the receiving coil and an imposed requirement that the induced voltage is, at most, $50 \%$ of the 0.5 V margin at the decoder, a maximum allowable magnetic field is calculated, as shown in Figure 27.

Figure 27. Maximum Allowable External Magnetic Flux Density
For example, at a magnetic field frequency of 1 MHz , the maximum allowable magnetic field of 0.2 kGauss induces a voltage of 0.25 V at the receiving coil. This is about $50 \%$ of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurs during a transmitted pulse and is the worst-case polarity, it reduces the received pulse from $>1.0 \mathrm{~V}$ to 0.75 V . This is well above the 0.5 V sensing threshold of the decoder.

These magnetic flux density values are shown in Figure 28, using more familiar quantities such as maximum allowable current flow, at given distances away from the ADM2483 transformers.

Figure 28. Maximum Allowable Current for Various Current-to-ADM2483 Spacings

At combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces could induce large enough error voltages to trigger the thresholds of succeeding circuitry. To avoid this possibility, care should be taken in the layout of such traces.

## APPLICATIONS INFORMATION

## POWER_VALID INPUT

To avoid chatter on the A and B outputs caused by slow powerup and power-down transients on $V_{D D 1}(>100 \mu \mathrm{~s} / \mathrm{V})$, the ADM2483 features a power_valid (PV) digital input. This pin should be driven low until $V_{D D 1}$ exceeds 2.0 V . When $V_{D D 1}$ is greater than 2.0 V , the pin should be driven high. Conversely, upon power-down, the PV should be driven low before $\mathrm{V}_{\mathrm{DD1}}$ reaches 2.0 V .

The power_valid input can be driven, for example, by the output of a system reset circuit such as the ADM809Z, which has a threshold voltage of 2.32 V .

Figure 29. Driving PV with ADM809Z

## ISOLATED POWER SUPPLY CIRCUIT

The ADM2483 requires isolated power capable of 5 V at 100 mA to be supplied between the $\mathrm{V}_{\mathrm{DD} 2}$ and $\mathrm{GND}_{2}$ pins. If no suitable integrated power supply is available, a discrete circuit, such as the one in Figure 30, can be used. A center-tapped transformer provides electrical isolation. The primary winding is excited with a pair of square waveforms that are $180^{\circ}$ out of phase with each other. A pair of Schottky diodes and a smoothing capacitor are used to create a rectified signal from the secondary winding. The ADP667 linear voltage regulator provides a regulated power supply to the ADM2483's bus-side circuitry.

To create the pair of square waves, a D-type flip-flop with complementary $\mathrm{Q} / \overline{\mathrm{Q}}$ outputs is used. The flip-flop can be connected so that output Q follows the clock input signal. If no local clock signal is available, a simple digital oscillator can be implemented with a hex-inverting Schmitt trigger and a resistor and capacitor. In this case, values of $3.9 \mathrm{k} \Omega$ and 1 nF generate a 364 kHz square wave. A pair of discrete NMOS transistors, switched by the $\mathrm{Q} / \overline{\mathrm{Q}}$ flip-flop outputs, conduct current through the center tap of the primary transformer, winding in an alternating fashion.

## OUTLINE DIMENSIONS

COMPLIANT TO JEDEC STANDARDS MS-013AA CONTROLLING DIMENSIONS ARE IN MILLIMETERS; INCH DIMENSIONS (IN PARENTHESES) ARE ROUNDED-OFF MILLIMETER EQUIVALENTS FOR REFERENCE ONLY AND ARE NOT APPROPRIATE FOR USE IN DESIGN

Figure 31. 16-Lead Standard Small Outline Package [SOIC] Wide Body (RW-16)
Dimensions shown in millimeters and (inches)

| Model | Data Rate (kbps) | Temperature Range | Package Description | Package Option |
| :---: | :---: | :---: | :---: | :---: |
| ADM2483BRW | 500 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16-Lead, Wide Body SOIC | RW-16 |
| ADM2483BRW-REEL ${ }^{1}$ | 500 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16-Lead, Wide Body SOIC | RW-16 |
| ADM2483BRWZ ${ }^{2}$ | 500 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16-Lead, Wide Body SOIC | RW-16 |
| ADM2483BRWZ-REEL ${ }^{1,2}$ | 500 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16-Lead, Wide Body SOIC | RW-16 |

${ }^{1}$ A -REEL suffix designates a 13 -inch (1,000 units) tape-and-reel option.
${ }^{2} Z=P b$-free part.

NOTES

## NOTES

[^0]:    ${ }^{1}$ Common-mode transient immunity is the maximum common-mode voltage slew rate that can be sustained while maintaining specification-compliant operation. $\mathrm{V}_{\text {CM }}$ is the common-mode potential difference between the logic and bus sides. The transient magnitude is the range over which the common mode is slewed. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.
