#### **Test Method** :

The specified electro-optical characteristics is satisfied under the following Conditions at the controllable distance.

①Measurement place

A place that is nothing of extreme light reflected in the room.

②External light

Project the light of ordinary white fluorescent lamps which are not high
Frequency lamps and must be less then 10 Lux at the module surface.
(Ee ≤ 10Lux)

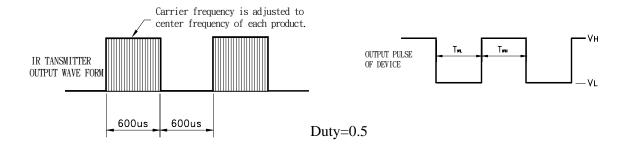

③Standard transmitter

A transmitter whose output is so adjusted as to Vo=400mVp-p and the output
Wave form shown in Fig.-1.According to the measurement method shown in Fig.-2 the standard transmitter is specified.
However, the infrared photodiode to be used for the transmitter should be λp=940nm, Δλ=50nm. Also, photodiode is used of PD438B(Vr=5V).

According to the measuring system shown in Fig.-3

#### The Notice of Application:

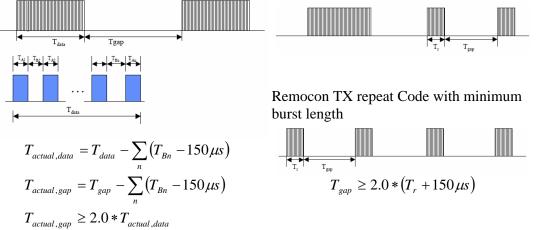

Transmission o remote control signal consist of four parts: Encode Part, IR Transmitter Source, IRM device, Decode Part

- 1. When IRM-27xxA code select frequency, it need to well understand the center system of encode part.
- 2. Strong or weak light of IR Transmitter can affect distance of transmission.
- 3. When using IRM-27xxA device, it requires the composition of code pattern to reach the demand as follows:

Remocon TX code with Repeat key

Minimum Burst Length tburst (number of pulses per burst) : 10 cycles Minimum data pause time:

Remocon Tx code with Full frame Repeat

4. It needs to ensure the translation range of decode part if it is applied to the pulse-width range.

If the above items hardly assure of its application, it'll cause NG(no good) message from the edge of signal.
