Voltage Detector IC Series

Low Voltage Free Delay Time Setting CMOS Voltage Detector IC Series BU42□□G/F/FVE, BU43□□G/F/FVE Series

●General Description

ROHM CMOS reset IC series with adjustable output delay is a high-accuracy low current consumption reset IC series with a built-in delay circuit. The lineup was established with two output types (Nch open drain and CMOS output) and detection voltages range from 0.9V to 4.8V in increments of 0.1V, so that the series may be selected according to the application at hand.

●Features

1) Detection voltage from 0.9V to 4.8V in 0.1V increments
2) Highly accurate detection voltage: ±1.0%
3) Ultra-low current consumption
4) Nch open drain output (BU42□□G/F/FVE)and CMOS output (BU43□□G/F/FVE)
5) Small surface package : SSOP5(BU42□□G, BU43□□G)
   : SOP4(BU42□□F, BU43□□F)
   : VSOF5(BU42□□FVE, BU43□□FVE)

●Applications

All electronics devices that use microcontrollers and logic circuits.

●Selection Guide

Part Number : BU4□ □ □ □

① ② ③

●ABSOLUTE MAXIMUM RATINGS(Ta=25°C)

Parameter		Symbol	Limits	Unit
Power Supply Voltage		VDD-GND	-0.3 to +7	V
Output Voltage	Nch Open Drain Output	VOUT	GND-0.3 to +7	V
	CMOS Output		GND-0.3 to VDD+0.3	
Power Dissipation	SSOP5 *1 *4	Pd	540	mW
	SOP4 *2 *4		400	
	VSOF5 *3 *4		210	
Operating Temperature		Topr	-40 to +125	°C
Ambient Storage Temperature		Tstg	-55 to +125	°C

*1 When used at temperatures higher than Ta=25°C,the power is reduced by 5.4mW per 1°C above 25°C
*2 When used at temperatures higher than Ta=25°C,the power is reduced by 4.0mW per 1°C above 25°C
*3 When used at temperatures higher than Ta=25°C,the power is reduced by 2.1mW per 1°C above 25°C
*4 When a ROHM standard circuit board (70mm×70mm×1.6mm, glass epoxy board) is mounted.

●ELECTRICAL CHARACTERISTICS (Unless specified otherwise, Ta=-25°C to +125°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions
Detection Voltage	VDET	VDET(T)×0.99	VDET (T)	VDET(T)×1.01	V	VDD=H→L,RL=470kΩ *1
Detection Voltage Temperature Coefficient	VDET/ΔT	-	±30	-	ppm/ °C	Ta=-40°C to +125°C (Designed Guarantee)
Hysteresis Voltage	ΔVDET	VDET×0.03	VDET×0.05	VDET×0.07	V	VDET≥1.1V,RL=470kΩ,VDD=L→H→L
Circuit Current when ON	IDD1	-	0.40	1.75	μA	VDD=VDET-0.2V,VDET=4.3 to 4.8V
Circuit Current when OFF	IDD2	-	0.55	2.28	μA	VDD=VDET+2.0V,VDET=4.3 to 4.8V
Operating Voltage Range	VOPL	0.7	-	-	V	VOL≤0.4V,RL=470kΩ,Ta=25 to 125°C
"L" Output Current (Nch)	IOL	3.6	6.5	-	mA	VDS=0.5V,VDD=2.4V,VDET=2.7 to 4.8V
"H" Output Current (Pch)	IOH	2.0	4.0	-	mA	VDS=0.5V,VDD=6.0V,VDET=4.0 to 4.8V
CT pin Threshold Voltage	VCTH	VDD×0.40	VDD×0.50	VDD×0.60	V	VDD=VDET×1.1,RL=470kΩ,VDET=2.6 to 4.8V *1
Output Delay Resistance	RCT	9	10	11	MΩ	VDD=VDET×1.1,VCT=0.5V (Designed Guarantee)*1
CT pin Output Current	ICT	200	400	-	μA	VCT=0.5V,VDD=1.5V,VDET=1.7 to 4.8V

*1 Guarantee on Ta=25°C
Note) RL is unnecessary for CMOS output.
Note) Regarding the operating limit voltage
The VOUT output is unsettled when VDD is less than this voltage. It will be Open, High or Low.
Note) Hysteresis Voltage = (Reset Release Voltage) – (Reset Detection Voltage) [V]
VDET (T) : Set Value of Detection voltage (0.9V to 4.8V, 0.1Vstep)
Designed Guarantee. (Outgoing inspection is not done an all products.)

●Setting of Detector Delay Time

This detector IC can be set delay time at the rise of V_{DD} by the capacitor connected to CT terminal.

• Delay time at the rise of V_{DD} T_{PLH}:Time until when Vout rise to 1/2 of V_{DD} after V_{DD} rise up and beyond the release voltage ($V_{DET}+\Delta V_{DET}$)

$$T_{PLH}=-C_{CT}\times R_{CT}\times \ln\left(\frac{V_{DD}-V_{CTH}}{V_{DD}}\right)$$

C_{CT} : CT pin Externally Attached Capacitance

R_{CT} : CT pin Internal Impedance

V_{CTH} : CT pin Threshold Voltage

Ln : Natural Logarithm

●Reference Data

Examples of Output Failing Value (T_{PHL})

Part Number	T_{PHL} [μs]
BU4245G	275.7
BU4345G	359.3

*This data is for reference only.

This figure will vary with the application, so please confirm actual operation conditions before use.

●Explanation of Operation

For both the open drain type (Fig.15) and the CMOS output type (Fig.16) , the detection and release voltages are used as threshold voltages. When the voltage applied to the Vdd pins reaches the applicable threshold voltage, the Vout terminal voltage switches from either “High” to “Low” or from “Low” to “High”. BU42□□G/F/FVE and BU43□□G/F/FVE have delay time function which set T_{PLH} (Output “Low”→”High”) using an external capacitor (C_{CT}). Because the BU42□□G/F/FVE series uses an open drain output type, it is possible to connect a pull-up resistor to V_{DD} or another power supply [The output “High” voltage (V_{OUT}) in this case becomes V_{DD} or the voltage of the other power supply].

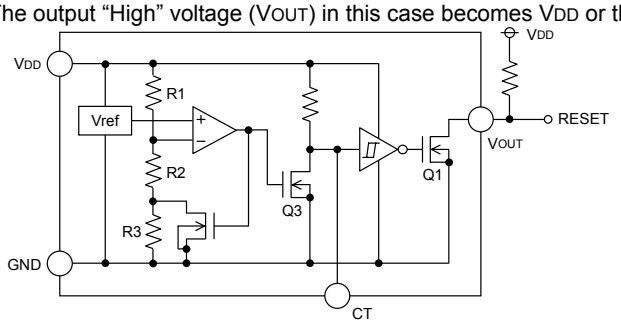

Fig.15 (BU42□□type internal block diagram)

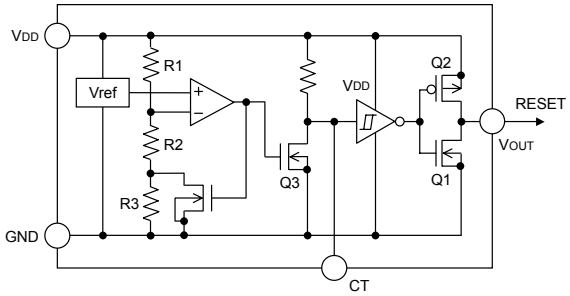

Fig.16 (BU43□□type internal block diagram)

●Timing Waveforms

Example:The following shows the relationship between the input voltage V_{DD}, the CT Terminal Voltage V_{CT} and the output voltage V_{OUT} when the input power supply voltage V_{DD} is made to sweep up and sweep down (The circuits are those in Figures 15 and 16).

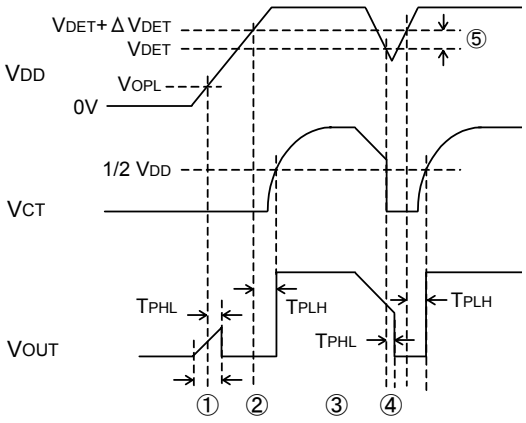

Fig.17

① When the power supply is turned on, the output is unsettled from after over the operating limit voltage (V_{OPL}) until T_{PHL}. There fore it is possible that the reset signal is not outputted when the rise time of VDD is faster than T_{PHL}.

② When V_{DD} is greater than V_{OPL} but less than the reset release voltage (V_{DET} + V_{DET}), the CT terminal (V_{CT}) and output (V_{OUT}) voltages will switch to L.

③ If V_{DD} exceeds the reset release voltage (V_{DET} + V_{DET}), then V_{OUT} switches from L to H (with a delay of T_{PLH} for setting the CT terminal).

④ If V_{DD} drops below the detection voltage (V_{DET}) when the power supply is powered down or when there is a power supply fluctuation, V_{OUT} switches to L (with a delay of T_{PHL}).

⑤ The potential difference between the detection voltage and the release voltage is known as the hysteresis width (V_{DET}). The system is designed such that the output does not flip-flop with power supply fluctuations within this hysteresis width, preventing malfunctions due to noise.

●Circuit Applications

1) Examples of a common power supply detection reset circuit

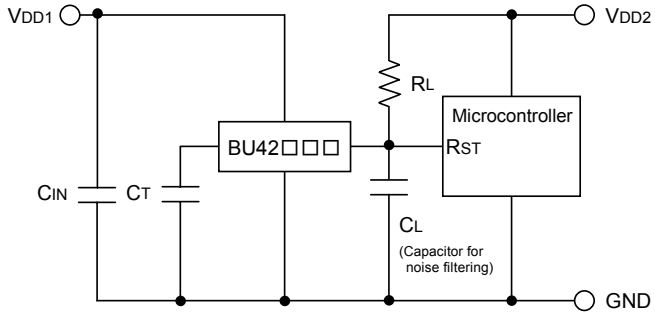

Fig.18 Open collector Output type

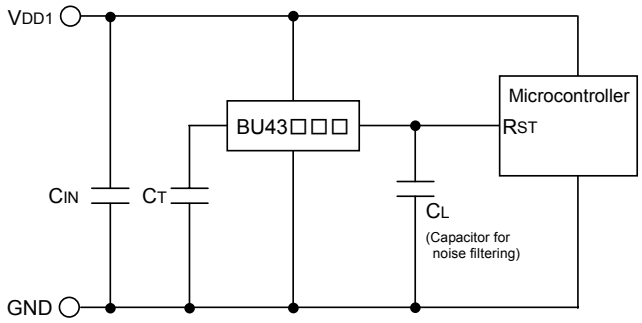

Fig.19 CMOS Output type

Application examples of BU42□□G/F/FVE series (Open Drain output type) and BU43□□G/F/FVE series (CMOS output type) are shown below.

CASE1:The power supply of the microcontroller (Vdd2) differs from the power supply of the reset detection (Vdd1). Use the Open Drain Output Type (BU42□□G/FVE) attached a load resistance (RL) between the output and Vdd2. (As shown Figure 18)

CASE2:The power supply of the microcontroller (Vdd1) is same as the power supply of the reset detection (Vdd1). Use CMOS output type (BU43□□G/FVE) or Open Drain Output Type (BU42□□G/FVE) attached a load resistance (RL) between the output and Vdd1. (As shown Figure 19)

When a capacitance CL for noise filtering is connected to the Vout pin (the reset signal input terminal of the microcontroller), please take into account the waveform of the rise and fall of the output voltage (Vout).

2) Examples of the power supply with resistor dividers

In applications where the power supply input terminal (VDD) of an IC with resistor dividers, it is possible that a through-current will momentarily flow into the circuit when the output logic switches, resulting in malfunctions (such as output oscillatory state).

(Through-current is a current that momentarily flows from the power supply (VDD) to ground (GND) when the output level switches from “High” to “Low” or vice versa.)

Consider the use of BD52□□when the power supply input it with resistor dividers.

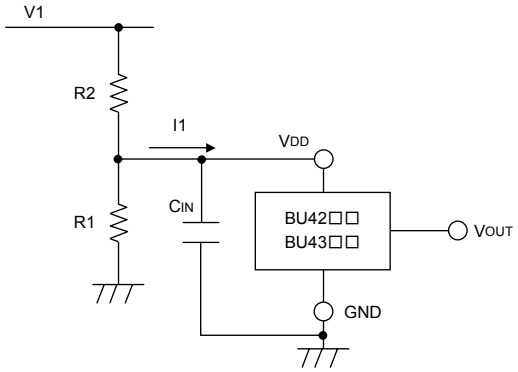

Fig.20

●Operation Notes

1．Absolute maximum range

Absolute Maximum Ratings are those values beyond which the life of a device may be destroyed. We cannot be defined the failure mode, such as short mode or open mode. Therefore a physical security countermeasure, like fuse, is to be given when a specific mode to be beyond absolute maximum ratings is considered.

2．GND potential

GND terminal should be a lowest voltage potential every state.
Please make sure all pins that are over ground even if include transient feature.

3．Electrical Characteristics

Be sure to check the electrical characteristics, that are one the tentative specification will be changed by temperature, supply voltage, and external circuit.

4．Bypass Capacitor for Noise Rejection

Please put into the to reject noise between V_{DD} pin and GND with 1uF over and between V_{OUT} pin and GND with 1000pF. If extremely big capacitor is used, transient response might be late. Please confirm sufficiently for the point.

5．Short Circuit between Terminal and Soldering

Don't short-circuit between Output pin and V_{DD} pin, Output pin and GND pin, or V_{DD} pin and GND pin. When soldering the IC on circuit board please is unusually cautious about the orientation and the position of the IC. When the orientation is mistaken the IC may be destroyed.

6．Electromagnetic Field

Mal-function may happen when the device is used in the strong electromagnetic field.

7． The V_{DD} line inpedance might cause oscillation because of the detection current.

8． A V_{DD} -GND capacitor (as close connection as possible) should be used in high V_{DD} line impedance condition.

9． Lower than the mininum input voltage makes the V_{OUT} high impedance, and it must be V_{DD} in pull up (V_{DD}) condition.

10. Case of needless Delay time, recommended to insert more 470kΩ resister between V_{DD} and CT.

11. Recommended value of RL Resistar is over 50kΩ (VDET=1.5 to 4.8V),
over 100kΩ (VDET=0.9 to 1.4V).

12. This IC has extremely high impedance terminals. Small leak current due to the uncleanness of PCB surface might cause unexpected operations. Application values in these conditions should be selected carefully. If 10MΩ leakage is assumed between the CT terminal and the GND terminal, 1MΩ connection between the CT terminal and the V_{DD} terminal would be recommended. Also, if the leakage is assumed between the V_{OUT} terminal and the GND terminal, the pull up resistor should be less than 1/10 of the assumed leak resistance.
The value of R_{CT} depends on the external resistor that is connected to CT terminal, so please consider the delay time that is decided by τ × RCT × CCT changes.

13. Delay time (tPLH)

$tPLH = \tau \times R_{CT} \times C_{CT}$ (sec)

τ : time constant
R_{CT} : 10M (typ.) (built-in resistor)
C_{CT} : capacitor connected CT pin.
Recommended value of C_{CT} capacitor is over 100pF.

The reference value

$(\tau \times R_{CT}) \times 10^6$

V_{DET} = 0.9 to 2.5V
Ta = 25°C (min. = 5.1×10^6 typ.= 6.0×10^6 max = 6.9×10^6)
Ta = -25 to 125°C (min. = 3.3v10^6 typ. = 6.0×10^6 max = 8.7×10^6)
V_{DET} = 2.6 to 4.8V
Ta = 25°C (min. = 5.9×10^6 typ.= 6.9×10^6 max = 7.9×10^6)

Downloaded from Elcodis.com electronic components distributor

Ta = -25 to 125°C (min. = 3.8×10^{6} typ.= 6.9×10^{6} max = 10.0×10^{6})

14. External parameters

The recommended parameter range for C_T is 100pF to 0.1μF. For R_L, the recommended range is 50kΩ to 1MΩ. There are many factors (board layout, etc) that can affect characteristics. Please verify and confirm using practical applications.

15. CT pin discharge

Due to the capabilities of the CT pin discharge transistor, the CT pin may not completely discharge when a short input pulse is applied, and in this case the delay time may not be controlled. Please verify the actual operation.

16. Power on reset operation

Please note that the power on reset output varies with the Vcc rise up time. Please verify the actual operation.

17. Precautions for board inspection

Connecting low-impedance capacitors to run inspections with the board may produce stress on the IC.
Therefore, be certain to use proper discharge procedure before each process of the test operation.
To prevent electrostatic accumulation and discharge in the assembly process, thoroughly ground yourself and any equipment that could sustain ESD damage, and continue observing ESD-prevention procedures in all handing, transfer and storage operations. Before attempting to connect components to the test setup, make certain that the power supply is OFF. Likewise, be sure the power supply is OFF before removing any component connected to the test setup.

18. When the power supply, is turned on because of incertain cases, momentary Rash-current flow into the IC at the logic unsettled, the couple capacitance, GND pattern of width and leading line must be considered.
