

An Energy-Efficient Solution from Freescale

MCF51MM256/128

MCF51MM256/128

The MCF51MM256 series devices are members of the low-cost, low-power, high-performance ColdFire® V1 family of 32-bit microcontrollers (MCUs) designed for handheld metering devices.

Not all features are available in all devices or packages; see [Table 2](#) for a comparison of features by device.

32-Bit ColdFire V1 Central Processor Unit (CPU)

- Up to 50.33-MHz ColdFire CPU above 2.4 V and 40 MHz CPU above 2.1 V and 20 MHz CPU above 1.8 V across temperature range of -40°C to 105°C.
- ColdFire Instruction Set Revision C (ISA_C).
- 32-bit multiply and accumulate (MAC) supports signed or unsigned integer or signed fractional inputs.

On-Chip Memory

- 256 K Flash comprised of two independent 128 K flash arrays; read/program/erase over full operating voltage and temperature; allows interrupt processing while programming.
- 32 Kbytes System Random-access memory (RAM).
- Security circuitry to prevent unauthorized access to RAM and Flash contents.

Power-Saving Modes

- Two ultra-low power stop modes. Peripheral clock enable register can disable clocks to unused modules to reduce currents.
- Time of Day (TOD) — Ultra low-power 1/4 sec counter with up to 64s timeout.
- Ultra-low power external oscillator that can be used in stop modes to provide accurate clock source to the TOD. 6 usec typical wake up time from stop3 mode.

Clock Source Options

- Oscillator (XOSC1) — Loop-control Pierce oscillator; 32.768 kHz crystal or ceramic resonator dedicated for TOD operation.
- Oscillator (XOSC2) for high frequency crystal input for MCG reference to be used for system clock and USB operations.
- Multipurpose Clock Generator (MCG) — PLL and FLL; precision trimming of internal reference allows 0.2% resolution and 2% deviation over temperature and voltage; supports CPU frequencies from 4 kHz to 50 MHz.

System Protection

- Watchdog computer operating properly (COP) reset with option to run from dedicated 1 kHz internal clock source or bus clock.
- Low-voltage detection with reset or interrupt; selectable trip points; separate low voltage warning with optional interrupt; selectable trip points.
- Illegal opcode and illegal address detection with reset.
- Flash block protection for each array to prevent accidental write/erasure.
- Hardware CRC to support fast cyclic redundancy checks.

Development Support

- Integrated ColdFire DEBUG_Rev_B+ interface with single wire BDM connection supports same electrical interface used by the S08 family debug modules.
- Real-time debug with 6 hardware breakpoints (4 PC, 1 address and 1 data).
- On-chip trace buffer provides programmable start/stop recording conditions.

Peripherals

- **USB** — Dual-role USB On-The-Go (OTG) device, supports USB in either device, host or OTG configuration. On-chip transceiver and 3.3V regulator

- help save system cost, fully compliant with USB Specification 2.0. Allows control, bulk, interrupt and isochronous transfers.
- **SC1x** — Two serial communications interfaces with optional 13-bit break; option to connect Rx input to PRACMP output on SCI1 and SCI2; High current drive on Tx on SCI1 and SCI2; wake-up from stop3 on Rx edge.
- **SPI1** — Serial peripheral interface with 64-bit FIFO buffer; 16-bit or 8-bit data transfers; full-duplex or single-wire bidirectional; double-buffered transmit and receive; master or slave mode; MSB-first or LSB-first shifting.
- **SPI2** — Serial peripheral interface with full-duplex or single-wire bidirectional; Double-buffered transmit and receive; Master or Slave mode; MSB-first or LSB-first shifting.
- **IIC** — Up to 100 kbps with maximum bus loading; Multi-master operation; Programmable slave address; Interrupt driven byte-by-byte data transfer; supports broadcast mode and 11-bit addressing.
- **CMT** — Carrier Modulator timer for remote control communications. Carrier generator, modulator and driver for dedicated infrared out (IRO). Can be used as an output compare timer.
- **TPMx** — Two 4-channel Timer/PWM Module; Selectable input capture, output compare, or buffered edge- or center-aligned PWM on each channel; external clock input/pulse accumulator.
- **Mini-FlexBus** — Multi-function external bus interface with user programmable chip selects and the option to multiplex address and data lines.
- **PRACMP** — Analog comparator with selectable interrupt; compare option to programmable internal reference voltage; operation in stop3.

Measurement Engine

- **ADC16** — 16-bit successive approximation ADC with up to 4 dedicated differential channels and 8 single-ended channels; range compare function; 1.7 mV/°C temperature sensor; internal bandgap reference channel; operation in stop3; fully functional from 3.6 V to 1.8 V, Configurable hardware trigger for 8 Channel select and result registers.
- **PDB** — Programmable delay block with 16-bit counter and modulus and prescale to set reference clock to bus divided by 1 to bus divided by 2048; 8 trigger outputs for ADC module provides periodic coordination of ADC sampling sequence with sequence completion interrupt; Back-to-Back mode and Timed mode.
- **DAC** — 12-bit resolution; 16-word data buffers with configurable watermark.
- **OPAMPx** — 2 flexible operational amplifiers configurable for general operations; Low offset and temperature drift.
- **TRIAMPx** — 2 trans-impedance amplifiers dedicated for converting current inputs into voltages.

Input/Output

- Up to 68 GPIOs and 1 output-only pin.
- Voltage Reference output (VREFO).
- Dedicated infrared output pin with high current sink capability.
- Up to 16 KBI pins with selectable polarity.
- Up to 16 pins of rapid general purpose I/O.

General Purpose Operational Amplifier (OPAMP)	yes	yes	yes	yes	yes	yes
Trans-Impedance Amplifier (TRIAMP)	yes	yes	yes	yes	yes	yes

¹ Port I/O count does not include $\overline{\text{BLMS}}$, BKGD and IRQ. $\overline{\text{BLMS}}$ and BKGD are Output only, IRQ is input only.

² Each differential channel is comprised of 2 pin inputs.

The following table describes the functional units of the MCF51MM256/128.

Table 2. MCF51MM256/128 Functional Units

Unit	Function
Measurement Engine	DAC (digital to analog converter) — Used to output voltage levels.
	16-BIT SAR ADC (analog-to-digital converter) — Measures analog voltages at up to 16 bits of resolution. The ADC has up to four differential and 8 single-ended inputs.
	OPAMP — General purpose op amp used for signal filtering or amplification.
	TRIAMP — Transimpedance amplifier optimized for converting small currents into voltages.
	Measurement Engine PDB — The measurement engine PDB is used to precisely trigger the DAC and the ADC modules to complete sensor biasing and measuring.
Mini-FlexBus	Provides expansion capability for off-chip memory and peripherals.
USB On-the-Go	Supports the USB On-the-Go dual-role controller.
CMT (Carrier Modulator Timer)	Infrared output used for the Remote Controller operation.
MCG (Multipurpose Clock Generator)	Provides clocking options for the device, including a phase-locked loop (PLL) and frequency-locked loop (FLL) for multiplying slower reference clock sources.
BDM (Background Debug Module)	Provides single pin debugging interface (part of the V1 ColdFire core).
CF1 CORE (V1 ColdFire Core)	Executes programs and interrupt handlers.
PRACMP	Analog comparators for comparing external analog signals against each other, or a variety of reference levels.
COP (Computer Operating Properly)	Software Watchdog.
IRQ (Interrupt Request)	Single-pin high-priority interrupt (part of the V1 ColdFire core).
CRC (Cyclic Redundancy Check)	High-speed CRC calculation.
DBG (Debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core)
FLASH (Flash Memory)	Provides storage for program code, constants, and variables.
IIC (Inter-integrated Circuits)	Supports standard IIC communications protocol and SMBus.
INTC (Interrupt Controller)	Controls and prioritizes all device interrupts.
KBI1 & KBI2	Keyboard Interfaces 1 and 2.
LVD (Low-voltage Detect)	Provides an interrupt to the ColdFire V1 CORE in the event that the supply voltage drops below a critical value. The LVD can also be programmed to reset the device upon a low voltage event.
VREF (Voltage Reference)	The Voltage Reference output is available for both on- and off-chip use.
RAM (Random-Access Memory)	Provides stack and variable storage.
RGPIO (Rapid General-purpose Input/output)	Allows for I/O port access at CPU clock speeds. RGPIO is used to implement GPIO functionality.

Table 2. MCF51MM256/128 Functional Units (continued)

Unit	Function
SCI1, SCI2 (Serial Communications Interfaces)	Serial communications UARTs capable of supporting RS-232 and LIN protocols.
SIM (system integration unit)	
SPI1 (FIFO), SPI2 (Serial Peripheral Interfaces)	SPI1 and SPI2 provide standard master/slave capability. SPI contains a FIFO buffer in order to increase the throughput for this peripheral.
TPM1, TPM2 (Timer/PWM Module)	Timer/PWM module can be used for a variety of generic timer operations as well as pulse-width modulation.
VREG (Voltage Regulator)	Controls power management across the device.
XOSC1 and XOSC2 (Crystal Oscillators)	These devices incorporate redundant crystal oscillators. One is intended primarily for use by the TOD, and the other by the CPU and other peripherals.

2 Pinouts and Pin Assignments

2.1 104-Pin MAPBGA

3 Preliminary Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the MCF51MM256/128 microcontroller, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

3.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 4. Parameter Classifications

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

3.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

Table 5. Absolute Maximum Ratings

#	Rating	Symbol	Value	Unit
1	Supply voltage	V_{DD}	-0.3 to +3.8	V
2	Maximum current into V_{DD}	I_{DD}	120	mA
3	Digital input voltage	V_{In}	-0.3 to $V_{DD} + 0.3$	V
4	Instantaneous maximum current Single pin limit (applies to all port pins) ^{1, 2, 3}	I_D	± 25	mA
5	Storage temperature range	T_{stg}	-55 to 150	°C

¹ Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive (V_{DD}) and negative (V_{SS}) clamp voltages, then use the larger of the two resistance values.

² All functional non-supply pins are internally clamped to V_{SS} and V_{DD} .

³ Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD} , the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low (which would reduce overall power consumption).

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}).

3.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and it is user-determined rather than being controlled by the MCU design. In order to take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 6. Thermal Characteristics

#	Symbol	Rating	Value	Unit	
1	T_A	Operating temperature range (packaged):		°C	
			MCF51MM256		–40 to 105
			MCF51MM128		–40 to 105
2	T_{JM}	Maximum junction temperature	150	°C	
3	θ_{JA}	Thermal resistance ^{1,2,3,4} Single-layer board — 1s		°C/W	
			104-pin MBGA		67
			100-pin LQFP		53
			81-pin MBGA		67
			80-pin LQFP		53
4	θ_{JA}	Thermal resistance ^{1, 2, 3, 4} Four-layer board — 2s2p		°C/W	
			104-pin MBGA		39
			100-pin LQFP		41
			81-pin MBGA		39
			80-pin LQFP		39

¹ Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

² Junction to Ambient Natural Convection

³ 1s — Single layer board, one signal layer

⁴ 2s2p — Four layer board, 2 signal and 2 power layers

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

where:

T_A = Ambient temperature, °C

θ_{JA} = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$, Watts — chip internal power

$P_{I/O}$ = Power dissipation on input and output pins — user determined

For most applications, $P_{I/O} \ll P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273^\circ\text{C}) \quad \text{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from Equation 3 by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving Equation 1 and Equation 2 iteratively for any value of T_A .

3.4 ESD Protection Characteristics

Although damage from static discharge is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with CDF-AEC-Q00 Stress Test Qualification for Automotive Grade Integrated Circuits. (<http://www.aecouncil.com/>) This device was qualified to AEC-Q100 Rev E.

A device is considered to have failed if, after exposure to ESD pulses, the device no longer meets the device specification requirements. Complete dc parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

Table 7. ESD and Latch-up Test Conditions

Model	Description	Symbol	Value	Unit
Human Body	Series Resistance	R1	1500	Ω
	Storage Capacitance	C	100	pF
	Number of Pulse per pin	—	3	—
Machine	Series Resistance	R1	0	Ω
	Storage Capacitance	C	200	pF
	Number of Pulse per pin	—	3	—
Latch-up	Minimum input voltage limit	—	-2.5	V
	Maximum input voltage limit	—	7.5	V

Table 8. ESD and Latch-Up Protection Characteristics

#	Rating	Symbol	Min	Max	Unit	C
1	Human Body Model (HBM)	V_{HBM}	±2000	—	V	T
2	Machine Model (MM)	V_{MM}	±200	—	V	T
3	Charge Device Model (CDM)	V_{CDM}	±500	—	V	T
4	Latch-up Current at $T_A = 125^\circ\text{C}$	I_{LAT}	±100	—	mA	T

3.5 DC Characteristics

This section includes information about power supply requirements, I/O pin characteristics, and power supply current in various operating modes.

Table 9. DC Characteristics

Num	Symbol	Characteristic	Condition	Min	Typ ¹	Max	Unit	C	
1	—	Operating Voltage	—	1.8 ²	—	3.6	V	—

			V _{DD} rising							
			—	1.86	1.90	1.99	V	P		

Table 9. DC Characteristics (continued)

Num	Symbol	Characteristic	Condition	Min	Typ ¹	Max	Unit	C	
21	V _{LVWH}	Low-voltage warning threshold — high range ¹⁴	V _{DD} falling	—	2.36	2.46	2.56	V	P
			V _{DD} rising	—	2.36	2.46	2.56	V	P
22	V _{LVWL}	Low-voltage warning threshold — low range ¹⁴	V _{DD} falling	—	2.11	2.16	2.22	V	P
			V _{DD} rising	—	2.16	2.21	2.27	V	P
23	V _{hys}	Low-voltage inhibit reset/recover hysteresis ¹⁴	—	—	50	—	mV	C	
24	V _{BG}	Bandgap Voltage Reference ¹⁰	—	1.145	1.17	1.195	V	P	

¹ Typical values are measured at 25°C. Characterized, not tested

² As the supply voltage rises, the LVD circuit will hold the MCU in reset until the supply has risen above V_{LVDL}.

³ Measured with V_{In} = V_{DD}.

⁴ All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

⁵ Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

⁶ Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current (V_{In} > V_{DD}) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

⁷ Maximum is highest voltage that POR is guaranteed.

⁸ Run at 1 MHz bus frequency

⁹ Low voltage detection and warning limits measured at 1 MHz bus frequency.

¹⁰ Factory trimmed at V_{DD} = 3.0 V, Temp = 25°C

3.6 Supply Current Characteristics

		PLL	t _{pll_lock}	—	—	t _{pll_acquire+} 1075(1/f _{pll_ref})		D
13	Loss of external clock minimum frequency - RANGE = 0	f _{loc_low}	(3/5) x f _{int_t}	—	—	kHz	D	
14	Loss of external clock minimum frequency - RANGE = 1	f _{loc_high}	(16/5) x f _{int_t}	—	—	kHz	D	

¹ This should not exceed the maximum CPU frequency for this device.

² This specification applies to any time the FLL reference source or reference divider is changed, trim value is changed, DMX32 bit is changed, DRS bit is changed, or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

³ This specification applies to any time the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

⁴ Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{BUS}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.

⁵ 625 ns represents 5 time quanta for CAN applications, under worst-case conditions of 8 MHz CAN bus clock, 1 Mbps CAN Bus speed, and 8 time quanta per bit for bit time settings. 5 time quanta is the minimum time between a synchronization edge and the sample point of a bit using 8 time quanta per bit.

⁶ Below D_{lock} minimum, the MCG is guaranteed to enter lock. Above D_{lock} maximum, the MCG will not enter lock. But if the MCG is already in lock, then the MCG may stay in lock.

⁷ Below D_{unl} minimum, the MCG will not exit lock if already in lock. Above D_{unl} maximum, the MCG is guaranteed to exit lock.

Table 18. XOSC (Temperature Range = -40 to 105°C Ambient)

		Low range, high gain (RANGE = 0, HGO = 1)		—	400	—		
		High range, low gain (RANGE = 1, HGO = 0)	t_{CSTH}	—	5	—		
		High range, high gain (RANGE = 1, HGO = 1)		—	15	—		

¹ Data in Typical column was characterized at 3.0 V, 25°C or is typical recommended value.

² When MCG is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz.

³ See crystal or resonator manufacturer's recommendation.

⁴ This parameter is characterized and not tested on each device.

⁵ Proper PC board layout procedures must be followed to achieve specifications.

3.11 Mini-FlexBus Timing Specifications

A multi-function external bus interface called Mini-FlexBus is provided with basic functionality to interface to slave-only devices up to a maximum bus frequency of 25.1666 MHz. It can be directly connected to asynchronous or synchronous devices such as external boot ROMs, flash memories, gate-array logic, or other simple target (slave) devices with little or no additional circuitry. For asynchronous devices a simple chip-select based interface can be used.

All processor bus timings are synchronous; that is, input setup/hold and output delay are given in respect to the rising edge of a reference clock, MB_CLK. The MB_CLK frequency is half the internal system bus frequency.

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the Mini-FlexBus output clock (MB_CLK). All other timing relationships can be derived from these values.

Table 19. Mini-FlexBus AC Timing Specifications

Num	C	Characteristic	Min	Max	Unit	Notes
—	—	Frequency of Operation	—	25.1666	MHz	—
MB1	D	Clock Period	39.73	—	ns	—
MB2	T	Output Valid	—	20	ns	1
MB3	D	Output Hold	1.0	—	ns	1
MB4	T	Input Setup	22	—	ns	2
MB5	D	Input Hold	10	—	ns	2

¹ Specification is valid for all MB_A[19:0], MB_D[7:0], $\overline{\text{MB_CS}}[1:0]$, $\overline{\text{MB_OE}}$, MB_R/W, and MB_ALE.

² Specification is valid for all MB_D[7:0].

Figure 9. Mini-FlexBus Read Timing

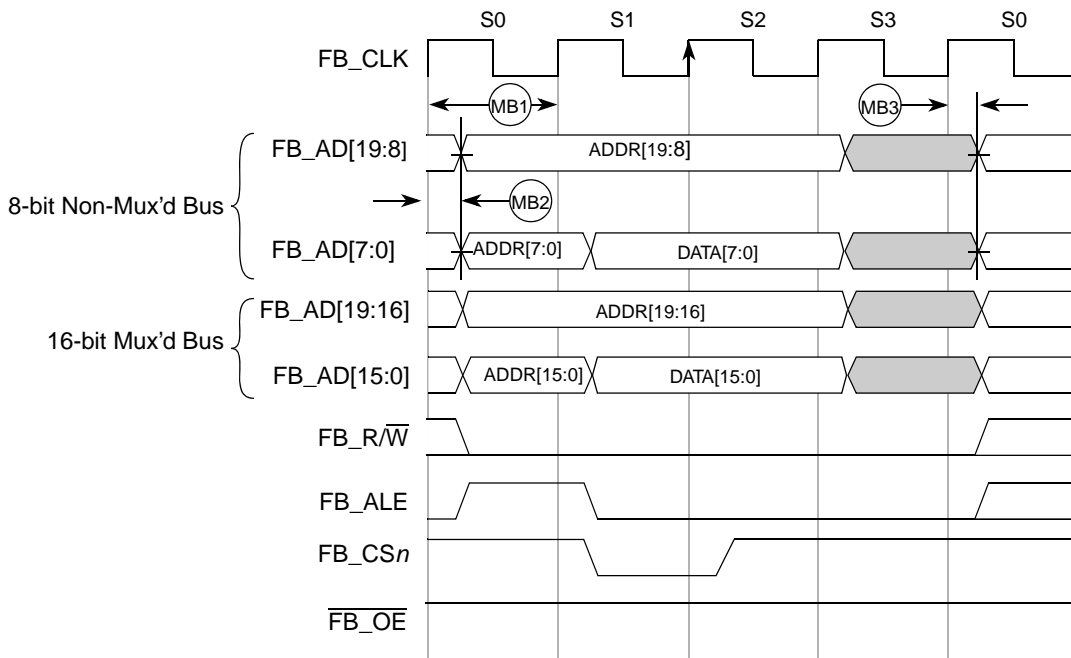

Figure 10. Mini-FlexBus Write Timing

3.12 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

3.12.1 Control Timing

Table 20. Control Timing

#	Symbol	Parameter	Min	Typical ¹	Max	C	Unit	
1	f_{Bus}	Bus frequency ($t_{cyc} = 1/f_{Bus}$)	$V_{DD} \geq 1.8\text{ V}$	dc	—	10	D	MHz
			$V_{DD} > 2.1\text{ V}$	dc	—	20	D	
			$V_{DD} > 2.4\text{ V}$	dc	—	25.165	D	
2	t_{LPO}	Internal low-power oscillator period	800	990 (TBD)	1500	D	μs	
3	t_{extrst}	External reset pulse width ² ($t_{cyc} = 1/f_{Self_reset}$)	100	—	—	D	ns	
4	t_{rstdrv}	Reset low drive	$66 \times t_{cyc}$	—	—	D	ns	
5	t_{MSSU}	Active background debug mode latch setup time	500	—	—	D	ns	
6	t_{MSH}	Active background debug mode latch hold time	100	—	—	D	ns	
7	t_{LIH}, t_{HIL}	IRQ pulse width • Asynchronous path ² • Synchronous path ³	100	—	—	D	ns	
			$1.5 \times t_{cyc}$					
8	t_{LIH}, t_{HIL}	KBIPx pulse width • Asynchronous path ² • Synchronous path ³	100	—	—	D	ns	
			$1.5 \times t_{cyc}$					
9	t_{Rise}, t_{Fall}	Port rise and fall time (load = 50 pF) ⁴ , Low Drive	Slew rate control disabled (PTxSE = 0)	—	11	—	D	ns
			Slew rate control enabled (PTxSE = 1)	—	35	—	D	
			Slew rate control disabled (PTxSE = 0)	—	40	—	D	
			Slew rate control enabled (PTxSE = 1)	—	75	—	D	

¹ Typical values are based on characterization data at $V_{DD} = 5.0\text{ V}$, 25 °C unless otherwise stated.

² This is the shortest pulse that is guaranteed to be recognized as a reset pin request. Shorter pulses are not guaranteed to override reset requests from internal sources.

³ This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.

⁴ Timing is shown with respect to 20% V_{DD} and 80% V_{DD} levels. Temperature range -40 °C to 105 °C.

Figure 11. Reset Timing

Figure 12. IRQ/KBIPx Timing

3.12.2 TPM Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 21. TPM Input Timing

#	C	Function	Symbol	Min	Max	Unit
1	—	External clock frequency	f_{TPMext}	dc	$f_{\text{Bus}}/4$	MHz

3.14 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the Flash memory.

Program and erase operations do not require any special power sources other than the normal V_{DD} supply. For more detailed information about program/erase operations, see the Memory chapter in the Reference Manual for this device (MCF51MM256RM).

Table 23. Flash Characteristics

#	Characteristic	Symbol	Min	Typical	Max	Unit	C
1	Supply voltage for program/erase -40°C to 105°C	$V_{prog/erase}$	1.8	—	3.6	V	D
2	Supply voltage for read operation	V_{Read}	1.8	—	3.6	V	D
3	Internal FCLK frequency ¹	f_{FCLK}	150	—	200	kHz	D
4	Internal FCLK period (1/FCLK)	t_{FcyC}	5	—	6.67	μs	D
5	Byte program time (random location) ²	t_{prog}	9			t_{FcyC}	P
6	Byte program time (burst mode) ²	t_{Burst}	4			t_{FcyC}	P
7	Page erase time ²	t_{Page}	4000			t_{FcyC}	P
8	Mass erase time ²	t_{Mass}	20,000			t_{FcyC}	P
9	Program/erase endurance ³ T_L to $T_H = -40°C$ to $+105°C$ $T = 25°C$		10,000 —	— 100,000	— —	cycles	C
10	Data retention ⁴	t_{D_ret}	15	100	—	years	C

¹ The frequency of this clock is controlled by a software setting.

Preliminary Electrical Characteristics

- ² These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.
- ³ **Typical endurance for flash** was evaluated for this product family on the HC9S12Dx64. For additional information on how Freescale defines typical endurance, please refer to Engineering Bulletin EB619, *Typical Endurance for Nonvolatile Memory*.
- ⁴ **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25°C using the Arrhenius equation. For additional information on how Freescale defines typical data retention, please refer to Engineering Bulletin EB618, *Typical Data Retention for Nonvolatile Memory*.

3.15 USB Electricals

The USB electricals for the USB On-the-Go module conform to the standards documented by the Universal Serial Bus Implementers Forum. For the most up-to-date standards, visit <http://www.usb.org>.

If the Freescale USB On-the-Go implementation has electrical characteristics that deviate from the standard or require additional information, this space would be used to communicate that information.

Table 24. Internal USB 3.3 V Voltage Regulator Characteristics

#	Characteristic	Symbol	Min	Typ	Max	Unit	C
1	Regulator operating voltage	V_{regin}	3.9	—	5.5	V	C
2	VREG output	V_{regout}	3	3.3	3.6	V	P
3	V_{USB33} input with internal VREG disabled	V_{usb33in}	3	3.3	3.6	V	C
4	VREG Quiescent Current	I_{VRQ}	—	0.5	—	mA	C

3.16 VREF Electrical Specifications

Table 25. VREF Electrical Specifications

Num	Characteristic	Symbol	Min	Max	Unit	C
1	Supply voltage	V_{DDA}	1.80	3.6	V	C
2	Temperature	T_A	-40	105	°C	C
3	Output Load Capacitance	C_L	—	100	nf	D
4	Maximum Load	—	—	10	mA	—
5	Voltage Reference Output with Factory Trim. $V_{DD} = 3$ V.	V_{out}	1.148	1.152	V	P
6	Temperature Drift ($V_{min} - V_{max}$ across the full temperature range)	T_{drift}	—	10 (TBD)	mV ¹	T
7	Aging Coefficient	A_c	—	TBD	ppm/year	C
8	Powered down Current (Off Mode, $V_{REFEN}=0$, $V_{RSTEN}=0$)	I	—	0.10	μA	C
9	Bandgap only (MODE_LV[1:0] = 00)	I	—	75	μA	T
10	Low-Power buffer (MODE_LV[1:0] = 01)	I	—	125	μA	T
11	Tight-Regulation buffer (MODE_LV[1:0] = 10)	I	—	1.1	mA	T
12	Load Regulation MODE_LV = 10	—	—	100	μV/mA	C
13	Line Regulation (Power Supply Rejection)	DC	—	TBD	mV	C
14		AC	TBD	—	dB

3.17 TRIAMP Electrical Parameters

Table 28. TRIAMP Characteristics 1.8-3.6 V, -40°C~105°C

#	Characteristic ¹	Symbol	Min	Typ ²	Max	Unit	C
1	Operating Voltage	V _{DD}	1.8	—	3.6	V	C
2	Supply Current (I _{OUT} =0mA, CL=0) Low-power mode	I _{SUPPLY}	—	80	TBD	μA	P
3	Supply Current (I _{OUT} =0mA, CL=0) High-speed mode	I _{SUPPLY}	—	350	TBD	μA	P
4	Input Offset Voltage	V _{OS}	—	± 3(TBD)	± 10	mV	C
5	Input Offset Voltage Temperature Coefficient	α _{VOS}	—	TBD	—	μV/C	C
6	Input Offset Current	I _{OS}	—	±270	TBD	pA	C
7	Input Bias Current (0 ~ 50°C)	I _{BIAS}	—	±300 (TBD)	±500 (TBD)	pA	C
8	Input Bias Current (-40 ~ 105°C)	I _{BIAS}	—	TBD	TBD	pA	C
9	Input Common Mode Voltage Low	V _{CM L}	0	—	—	V	D
10	Input Common Mode Voltage High	V _{CM H}	—	—	V _{DD} -1.4	V	C
11	Input Resistance	R _{IN}	500	—	—	MΩ	T
12	Input Capacitances	C _{IN}	—	—	5	pF	T
13	AC Input Impedance (f _{IN} =100kHz)	X _{IN}	—	50	—	MΩ	T
14	Input Common Mode Rejection Ratio	CMRR	60	70	—	dB	C
15	Power Supply Rejection Ration	PSRR	60	70	—	dB	C
16	Slew Rate (ΔV _{IN} =100mV) Low-power mode	SR	—	0.1	—	V/μs	C
17	Slew Rate (ΔV _{IN} =100mV) High-speed mode	SR	—	1	—	V/μs	C
18	Unity Gain Bandwidth (Low-power mode) 50pF	GBW	0.15	0.5	—	MHz	C
19	Unity Gain Bandwidth (High-speed mode) 50pF	GBW	—	2	—	MHz	C
20	DC Open Loop Voltage Gain (RL = 20 KΩ)	A _V	—	80	—	dB	C
21	Load Capacitance Driving Capability	CL(max)	—	—	50	pF	C
22	Output Resistance	R _{OUT}	—	TBD	—	Ω	C
23	Output Voltage Range	triout	0.15	—	V _{DD} - 0.15	V	C
24	Output Drive Capability	I _{OUT}	—	± 1.0	—	mA	C
25	Gain Margin	GM	20	—	—	dB	T
26	Phase Margin	PM	45	55	—	deg	C

¹ All parameters are measured at 3.3 V, CL= 47 pF across temperature -40 to + 105 °C unless specified.

Preliminary Electrical Characteristics

² Data in Typical column was characterized at 3.0 V, 25°C or is typical recommended value.

3.18 OPAMP Electrical Parameters

Table 29. OPAMP Characteristics 1.8-3.6 V

#	Characteristics ¹	Symbol	Min	Typ ²	Max	Unit	C
1	Operating Voltage	V_{DD}	1.8	—	3.6	V	C
2	Supply Current ($I_{OUT}=0mA$, $CL=0$) Low-power mode	I_{SUPPLY}	—	40	55 (TBD)	μA	P
3	Supply Current ($I_{OUT}=0mA$, $CL=0$) High-speed mode	I_{SUPPLY}	—	420 (TBD)	450 (TBD)	μA	P
4	Input Offset Voltage	V_{OS}	—	± 3	± 10	mV	C
5	Input Offset Voltage Temperature Coefficient	α_{VOS}	—	1	—	$\mu V/C$	C
6	Input Offset Current	I_{OS}	—	\pm TBD	\pm TBD	pA	C
7	Input Bias Current	I_{BIAS}	—	\pm TBD	\pm TBD	pA	C
8	Input Common Mode Voltage Low	V_{CML}	0.1	—	—	V	C
9	Input Common Mode Voltage High	V_{CMH}	—	—	$V_{DD}+0.1$	V	T
10	Input Resistance	R_{IN}	500	—	—	$M\Omega$	T
11	Input Capacitances	C_{IN}	—	—	10	pF	T
12	AC Input Impedance ($f_{IN}=100kHz$)	$ X_{IN} $	—	TBD	—	$M\Omega$	T
13	Input Common Mode Rejection Ratio	CMRR	55	65	—	dB	C
14	Power Supply Rejection Ration	PSRR	60	65	—	dB	C
15	Slew Rate ($\Delta V_{IN}=100mV$) Low-power mode	SR	0.1	—	—	$V/\mu s$	C
16	Slew Rate ($\Delta V_{IN}=100mV$) High speed mode	SR	1	—	—	$V/\mu s$	C
17	Unity Gain Bandwidth Low-power mode	GBW	0.2	—	—	MHz	C
18	Unity Gain Bandwidth High Speed mode	GBW	1	—	—	MHz	C
19	DC Open Loop Voltage Gain	A_V	80	90	—	dB	C
20	Load Capacitance Driving Capability	$CL(max)$	—	—	100	pF	C
21	Output Resistance	R_{OUT}	—	—	1500	Ω	C
22	Output Voltage Range	V_{OUT}	0.15	—	$V_{DD}-0.15$	V	C
23	Output Drive Capability	I_{OUT}	± 0.5	± 1.0	—	mA	C
24	Gain Margin	GM	20	—	—	dB	T
25	Phase Margin	PM	45	55	—	deg	C
26	GPAMP settling time (low-power mode) ($T_o < 0.1\%$, $V_{in} = 2V_{p-p}$, $CL = 25pF$, $RL = 2k$)	$T_{startup}$	—	TBD	—	μs	C
27	GPAMP settling time (low-power mode)	$T_{startup}$	—	TBD	—	μs	C
28	GPAMP settling time (high-speed mode) ($T_o < 0.1\%$, $V_{in} = 2V_{p-p}$, $CL = 25pF$, $RL = 2k$)	$T_{startup}$	—	TBD	—	μs	C
29	GPAMP settling time (high-speed mode)	$T_{startup}$	—	TBD	—	μs	C

¹ All parameters are measured at 3.3 V, $CL = 47 pF$ across temperature -40 to $+105^\circ C$ unless specified.

² Data in Typical column was characterized at 3.0 V, 25°C or is typical recommended value.

4 Ordering Information

This section contains ordering information for the device numbering system. See [Table 2](#) for feature summary by package information.

4.1 Device Numbering System

4.2 Part Numbers

Table 30. Orderable Part Number Summary

Freescall Part Number	Description	Flash / SRAM (Kbytes)	Package	Temperature
MCF51MM256VML	MCF51MM256 ColdFire Microcontroller	256K/32K	104 MAPBGA	-40 to 105 °C
MCF51MM256VLL	MCF51MM256 ColdFire Microcontroller	256K/32K	100 LQFP	-40 to 105 °C
MCF51MM256VMB	MCF51MM256 ColdFire Microcontroller	256K/32K	81 MAPBGA	-40 to 105 °C
MCF51MM256VLK	MCF51MM256 ColdFire Microcontroller	256K/32K	80 LQFP	-40 to 105 °C
MCF51MM128VMB	MCF51MM128 ColdFire Microcontroller	128K/32K	81 MAPBGA	-40 to 105 °C
MCF51MM128VLK	MCF51MM128 ColdFire Microcontroller	128K/32K	80 LQFP	-40 to 105 °C
MCF51MM256CML	MCF51MM256 ColdFire Microcontroller	256K/32K	104 MAPBGA	-40 to 85 °C
MCF51MM256CLL	MCF51MM256 ColdFire Microcontroller	256K/32K	100 LQFP	-40 to 85 °C
MCF51MM256CMB	MCF51MM256 ColdFire Microcontroller	256K/32K	81 MAPBGA	-40 to 85 °C
MCF51MM256CLK	MCF51MM256 ColdFire Microcontroller	256K/32K	80 LQFP	-40 to 85 °C
MCF51MM128CMB	MCF51MM128 ColdFire Microcontroller	128K/32K	81 MAPBGA	-40 to 85 °C
MCF51MM128CLK	MCF51MM128 ColdFire Microcontroller	128K/32K	80 LQFP	-40 to 85 °C

4.3 Package Information

Table 31. Package Descriptions

Pin Count	Package Type	Abbreviation	Designator	Case No.	Document No.
100	Low Quad Flat Package	LQFP	LL	983-03	98ASS23308W
80	Low Quad Flat Package	LQFP	LK	1418	98ASS23174W
104	MAPBGA Package	MAPBGA	ML	1285-02	98ARH98267A
81	MAPBGA Package	MAPBGA	MB	1662-01	98ASA10670D

4.4 Mechanical Drawings

[Table 31](#) provides the available package types and their document numbers. The latest package outline/mechanical drawings are available on the MCF51MM256/128 Product Summary pages at <http://www.freescale.com>.

To view the latest drawing, either:

- Click on the appropriate link in [Table 31](#), or
- Open a browser to the Freescale® website (<http://www.freescale.com>), and enter the appropriate document number (from [Table 31](#)) in the “Enter Keyword” search box at the top of the page.

5 Revision History

This section lists major changes between versions of the MCF51MM256 Data Sheet.

Table 32. Revision History

Revision	Date	Description
0	March/April 09	Initial Draft
1	July 09	<ul style="list-style-type: none"> • Revised to follow standard template. • Removed extraneous headings from the TOC. • Corrected units for Monotonicity to be blank in for the DAC specification. • Updated ADC characteristic tables to include 16-Bit SAR in headings.
2	July 09	<ul style="list-style-type: none"> • Changed MCG (XOSC) Electricals Table - Row 2, Average Internal Reference Frequency typical value from 32.768 to 31.25.
3	April 10	<ul style="list-style-type: none"> • Updated Thermal Characteristics table. Reinserted the 81 and 104 MapBGA devices. • Revised the ESD and Latch-Up Protection Characteristic description to read: Latch-up Current at $T_A = 125^\circ\text{C}$. • Changed Table . DC Characteristics rows 2 and 4, to 1.8 V, ILoad = -600 mA conditions to 1.8 V, ILoad = 600μA respectively. • Corrected the 16-bit SAR ADC Operating Condition table Ref Voltage High Min value to be 1.13 instead of 1.15. • Updated the ADC electricals. • Inserted the Mini-FlexBus Timing Specifications. • Added a Temp Drift parameter to the VREF Electrical Specifications. • Removed the S08 Naming Convention diagram. • Updated the Orderable Part Number Summary to include the Freescale Part Number suffixes. • Completed the Package Description table values. • Changed the 80LQFP package drawing from 98ARL10530D to 98ASS23174W. MM256 uses 80LQFP12x12. • Updated electrical characteristic data.
