

LTC6400-14

2.4GHz Low Noise, Low Distortion Differential ADC Driver for 300MHz IF

The LTC®6400-14 is a high-speed differential amplifier

targeted at processing signals from DC to 300MHz. The

part has been specifically designed to drive 12-, 14- and

16-bit ADCs with low noise and low distortion, but can also

The LTC6400-14 is easy to use, with minimal support

circuitry required. The output common mode voltage is

set using an external pin, independent of the inputs, which

eliminates the need for transformers or AC-coupling ca-

pacitors in many applications. The gain is internally fixed

The LTC6400-14 saves space and power compared to

alternative solutions using IF gain blocks and transformers.

The LTC6400-14 is packaged in a compact 16-lead 3mm \times

3mm QFN package and operates over the -40°C to 85°C

be used as a general-purpose broadband gain block.

DESCRIPTION

at 14dB (5V/V).

temperature range.

FEATURES

- 2.4GHz –3dB Bandwidth
- Fixed Gain of 5V/V (14dB)
- –97dBc IMD3 at 70MHz (Equivalent OIP3 = 52.4dBm)
- -66dBc IMD3 at 300MHz (Equivalent OIP3 = 36.9dBm)
- 1.1nV/√Hz Internal Op Amp Noise
- 2.5nV/√Hz Total Input Noise
- 7.5dB Noise Figure
- Differential Inputs and Outputs
- 200Ω Input Impedance
- 2.85V to 3.5V Supply Voltage
- 85mA Supply Current (255mW)
- 1V to 1.6V Output Common Mode Voltage, Adjustable
- DC- or AC-Coupled Operation
- Max Differential Output Swing 4.8V_{P-P}
- Small 16-Lead 3mm × 3mm × 0.75mm QFN Package

APPLICATIONS

- Differential ADC Driver
- Differential Driver/Receiver
- Single Ended to Differential Conversion
- IF Sampling Receivers
- SAW Filter Interfacing

LTC6400 AND LTC6401 SELECTOR GUIDE Please check each datasheet for complete details.

PART NUMBER	GAIN (dB)	GAIN (V/V)	Z _{IN} (DIFFERENTIAL) (Ω)	I _{CC} (mA)
LTC6400-8	8	2.5	400	85
LTC6400-14	14	5	200	85
LTC6400-20	20	10	200	90
LTC6400-26	26	20	50	85
LTC6401-8	8	2.5	400	45
LTC6401-14	14	5	200	45
LTC6401-20	20	10	200	50
LTC6401-26	26	20	50	45

In addition to the LTC6400 family of amplifiers, a lower power LTC6401 family is available. The LTC6401 is pin compatible to the LTC6400, and has the same low noise performance. The lower power consumption of the LTC6401 comes at the expense of slightly higher non-linearity, especially at input frequencies above 140MHz. Please refer to the separate LTC6401 data sheets for complete details.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: Input pins (+IN, -IN) are protected by steering diodes to either supply. If the inputs go beyond either supply rail, the input current should be limited to less than 10mA.

Note 3: The LTC6400C and LTC6400I are guaranteed functional over the operating temperature range of -40° C to 85° C.

Note 4: The LTC6400C is guaranteed to meet specified performance from 0°C to 70°C. It is designed, characterized and expected to meet specified performance from -40 to 85°C but is not tested or QA sampled at these temperatures. The LTC6400I is guaranteed to meet specified performance from -40°C to 85°C.

Note 5: Input and output baluns used. See Test Circuit A.

Note 6: Measured using Test Circuit B.

Note 7: Since the LTC6400-14 is a feedback amplifier with low output impedance, a resistive load is not required when driving an AD converter. Therefore, typical output power is very small. In order to compare the LTC6400-14 with amplifiers that require 50Ω output load, the LTC6400-14 output voltage swing driving a given R_L is converted to OIP3 and P_{1dB} as if it were driving a 50Ω load. Using this modified convention, $2V_{P-P}$ is by definition equal to 10dBm, regardless of actual R_L.

PIN FUNCTIONS

V⁺ (**Pins 1, 3, 10**): Positive Power Supply (Normally tied to 3V or 3.3V). All three pins must be tied to the same voltage. Bypass each pin with 1000pF and 0.1μ F capacitors as close to the pins as possible.

 V_{OCM} (Pin 2): This pin sets the output common mode voltage. A 0.1 μF external bypass capacitor is recommended.

V⁻ (Pins 4, 9, 12, 17): Negative Power Supply (GND). All four pins must be connected to same voltage/ground.

-OUT, +OUT (Pins 5, 8): Unfiltered Outputs. These pins have series resistors, R_{OUT} 12.5 Ω .

–OUTF, +OUTF (Pins 6, 7): Filtered Outputs. These pins have 50Ω series resistors and a 2.7pF shunt capacitor.

ENABLE (Pin 11): This pin is a logic input referenced to V_{EE}. If low, the part is enabled. If high, the part is disabled and draws approximately 1mA supply current.

+IN (Pins 13, 14): Positive Input. Pins 13 and 14 are internally shorted together.

-IN (Pins 15, 16): Negative Input. Pins 15 and 16 are internally shorted together.

Exposed Pad (Pin 17): V⁻. The Exposed Pad must be connected to same voltage/ground as pins 4, 9, 12.

BLOCK DIAGRAM

Circuit Operation

The LTC6400-14 is a low noise and low distortion fully differential op amp/ADC driver with:

- Operation from DC to 2.4GHz (-3dB bandwidth)
- Fixed gain of 5V/V (14dB)
- Differential input impedance 200Ω
- Differential output impedance 25Ω
- On-Chip 590MHz output filter

The LTC6400 is composed of a fully differential amplifier with on chip feedback and output common mode voltage control circuitry. Differential gain and input impedance are set by $100\Omega/1000\Omega$ resistors in the feedback network. Small output resistors of 12.5Ω improve the circuit stability over various load conditions. They also provide a possible external filtering option, which is often desirable when the load is an ADC.

Filter resistors of 50Ω are available for additional filtering. Lowpass/bandpass filters are easily implemented with just a couple of external components. Moreover, they offer single-ended 50Ω matching in wideband applications and no external resistor is needed.

The LTC6400-14 is very flexible in terms of I/O coupling. It can be AC- or DC-coupled at the inputs, the outputs or both. Due to the internal connection between input and output, users are advised to keep input common mode voltage between 1V and 1.8V for proper operation. If the inputs are AC-coupled, the input common mode voltage is automatically biased approximately 450mV above V_{OCM} and thus no external circuitry is needed for bias. The LTC6400-14 provides an output common mode voltage set by V_{OCM} , which allows driving an ADC directly without external components such as a transformer or AC coupling capacitors. The input signal can be either single-ended or differential with only minor differences in distortion performance.

Input Impedance and Matching

The differential input impedance of the LTC6400-14 is 200Ω . If a 200Ω source impedance is unavailable, then the differential inputs may need to be terminated to a lower

value impedance, e.g. 50Ω , in order to provide an impedance match for the source. Several choices are available. One approach is to use a differential shunt resistor (Figure 1). Another approach is to employ a wide band transformer (Figure 2). Both methods provide a wide band impedance match. The termination resistor or the transformer must be placed close to the input pins in order to minimize the reflection due to input mismatch. Alternatively, one could apply a narrowband impedance match at the inputs of the LTC6400-14 for frequency selection and/or noise reduction.

Referring to Figure 3, LTC6400-14 can be easily configured for single-ended input and differential output without a balun. The signal is fed to one of the inputs through a matching network while the other input is connected to the same matching network and a source resistor. Because the return ratios of the two feedback paths are equal, the two outputs have the same gain and thus symmetrical swing.

Figure 2. Input Termination for Differential 50 Ω Input Impedance Using a 1:4 Balun

Figure 3. Input Termination for Single-Ended 50 Ω Input Impedance

In general, the single-ended input impedance and termination resistor R_T are determined by the combination of R_S, R_G and R_F. For example, when R_S is 50 Ω , it is found that the single-ended input impedance is 202 Ω and R_T is 68.5 Ω in order to match to a 50 Ω source impedance.

The LTC6400-14 is unconditionally stable under normal bias conditions. However, the overall differential gain is affected by both source impedance and load impedance as shown in Figure 4:

$$A_{V} = \left| \frac{V_{OUT}}{V_{IN}} \right| = \frac{1000}{R_{S} + 200} \bullet \frac{R_{L}}{25 + R_{L}}$$

The noise performance of the LTC6400-14 also depends upon the source impedance and termination. For example, an input 1:4 balun transformer in Figure 2 improves SNR by adding 6dB of voltage gain at the inputs. A trade-off between gain and noise is obvious when constant noise figure circle and constant gain circle are plotted within the same input Smith Chart, based on which users can choose the optimal source impedance for a given gain and noise requirement.

Figure 4. Calculate Differential Gain

Output Match and Filter

The LTC6400-14 can drive an ADC directly without external output impedance matching. Alternatively, the differential output impedance of 25Ω can be matched to higher value impedance, e.g. 50Ω , by series resistors or an LC network.

The internal low pass filter outputs at +OUTF/–OUTF have a –3dB bandwidth of 590MHz. External capacitors can reduce the low pass filter bandwidth as shown in Figure 5. A bandpass filter is easily implemented with only a few components as shown in Figure 6. Three 39pF capacitors and a 16nH inductor create a bandpass filter with 165MHz center frequency, –3dB frequencies at 138MHz and 200MHz.

Output Common Mode Adjustment

The output common mode voltage is set by the V_{OCM} pin, which is a high impedance input. The output common mode voltage is capable of tracking V_{OCM} in a range from 1V to 1.6V. The bandwidth of V_{OCM} control is typically 16MHz,

Figure 5. LTC6400-14 Internal Filter Topology Modified for Low Filter Bandwidth (Three External Capacitors)

Figure 6. LTC6400-14 Internal Filter Topology Modified for Bandpass Filtering (Three External Capacitors, One External Inductor)

2

which is dominated by a low pass filter connected to the V_{OCM} pin and is aimed to reduce common mode noise generation at the outputs. The internal common mode feedback loop has a –3dB bandwidth around 400MHz, allowing fast common mode rejection at the outputs of the LTC6400-14. The V_{OCM} pin should be tied to a DC bias voltage with a 0.1µF bypass capacitor. When interfacing with A/D converters such as the LTC22xx families, the V_{OCM} pin can be connected to the V_{CM} pin of the ADC.

Driving A/D Converters

The LTC6400-14 has been specifically designed to interface directly with high speed A/D converters. In Figure 7, an example schematic shows the LTC6400-14 with a single-ended input driving the LTC2208, which is a 16-bit, 130Msps ADC. Two external 4.99 Ω resistors help eliminate potential resonance associated with stray capacitance of PCB traces and bond wires of either the ADC input or the driver output. V_{OCM} of the LTC6400-14 is connected to V_{CM} of the LTC2208 V_{CM} pin at 1.25V. Alternatively, a single-ended input signal can be converted to a differential signal via a balun and fed to the input of the LTC6400-14.

Figure 8 summarizes the IMD3 of the whole system in Figure 7. Note that Figure 7 shows a direct connection to the LTC2208, but in many applications an anti-alias filter would be desirable to limit the wideband noise of the amplifier. This is especially true in high performance 16-bit designs.

Test Circuits

Due to the fully-differential design of the LTC6400 and its usefulness in applications with differing characteristic

Figure 8. IMD3 for the Combination of LTC6400-14 and LTC2208

specifications, two test circuits are used to generate the information in this datasheet. Test Circuit A is DC987B, a two-port demonstration circuit for the LTC6400 family. The schematic and silkscreen are shown below. This circuit includes input and output transformers (baluns) for single-ended-to-differential conversion and impedance transformation, allowing direct hook-up to a 2-port

Top Silkscreen

network analyzer. There are also series resistors at the output to present the LTC6400 with a 375Ω differential load, optimizing distortion performance. Due to the input and output transformers, the –3dB bandwidth is reduced from 2.4GHz to approximately 1.8GHz.

Test Circuit B uses a 4-port network analyzer to measure S-parameters and gain/phase response. This removes the effects of the wideband baluns and associated circuitry, for a true picture of the >1GHz S-parameters and AC characteristics.

BOTTOM VIEW-EXPOSED PAD

1. DRAWING CONFORMS TO JEDEC PACKAGE OUTLINE MO-220 VARIATION (WEED-2) 2. DRAWING NOT TO SCALE

2. DRAWING NOT TO SCALE 3. ALL DIMENSIONS ARE IN MILLIMETERS 4. DIMENSIONS OF EXPOSED PAD ON BOTTOM OF PACKAGE DO NOT INCLUDE

MOLD FLASH. MOLD FLASH, IF OR RESENT, SHALL NOT EXCEED 0.15mm ON ANY SIDE 5. EXPOSED PAD SHALL BE SOLDER PLATED

6. SHADED AREA IS ONLY A REFERENCE FOR PIN 1 LOCATION

ON THE TOP AND BOTTOM OF PACKAGE

Information furnished by Linear Technology Corporation is believed to be accurate and reliable. However, no responsibility is assumed for its use. Linear Technology Corporation makes no representation that the interconnection of its circuits as described herein will not infringe on existing patent rights.
