Registered DDR2 SDRAM DIMM

## 240pin Registered DDR2 SDRAM MODULE Based on 64Mx8 & 128Mx4 DDR2 SDRAM Die B

### Features

- 64Mx72 Registered DDR2 DIMM based on 64Mx8 DDR2 SDRAM (NT5TU64M8BE)
- 128Mx72 & 256Mx72 Registered DDR2 DIMM based on 128Mx4 DDR2 SDRAM (NT5TU128M4BE)
- JEDEC Standard 240-pin Dual In-Line Memory Module
- Error Check Correction (ECC) Support
- Registered inputs with one-clock delay
- Performance:

	PC2-5300	PC2-6400	PC2-6400	
Speed Sort	-3C	-25D	-25C	Unit
DIMM $\overline{\text{CAS}}$ Latency	5	6	5	
f <sub>CK</sub> Clock Frequency	333	400	400	MHz
t <sub>CK</sub> Clock Cycle	3	2.5	2.5	ns
f <sub>DQ</sub> DQ Burst Frequency	667	800	800	MHz

- Intended for 333 and 400 MHz applications
- Inputs and outputs are SSTL-18 compatible
- $V_{DD} = 1.8 \pm 0.1$  Volt,  $V_{DDQ} = 1.8 \pm 0.1$  Volt
- SDRAMs have 4 internal banks for concurrent operation

- Differential clock inputs
- Data is read or written on both clock edges
- Programmable Operation:
  - Device  $\overline{\text{CAS}}$  Latency: 5, 6
  - Burst Type: Sequential or Interleave
  - Burst Length: 4, 8
  - Operation: Burst Read and Write
- Auto Refresh (CBR) and Self Refresh Modes
- On-Die Termination (ODT)
- Off-Chip Driver (OCD)
- 14/10/1 Addressing (row/column/rank) – 512MB
- 14/11/1 Addressing (row/column/rank) – 1GB
- 14/11/2 Addressing (row/column/rank) – 2GB
- Serial Presence Detect
- Gold contacts
- SDRAMs in 60-ball FBGA Package
- RoHS compliance

### Description

NT512T72U89B0BV, NT1GT72U4PB0BV, NT2GT72U4NB0BV and NT2GT72U4NB1BV are Registered 240-Pin Double Data Rate 2 (DDR2) Synchronous DRAM Dual In-Line Memory Module (DIMM), organized as a one-bank 64Mx72 or 128Mx72 and two-banks 256Mx72 high-speed memory array. The module uses nine 64Mx8 (NT512T72U89B0BV), eighteen 128Mx4 (NT1GT72U4PB0BV) or thirty-six 128Mx4 (NT2GT72U4NB0BV, NT2GT72U4NB1BV) DDR2 SDRAMs in FBGA packages. These DIMMs are manufactured using raw cards developed for broad industry use as reference designs. The use of these common design files minimizes electrical variation between suppliers. All NANYA DDR2 SDRAM DIMMs provide a high-performance, flexible 8-byte interface in a 5.25" long space-saving footprint.

The DIMM is intended for use in applications operating up to 333 MHz (400MHz) clock speeds and achieves high-speed data transfer rates of up to 667 MHz (800MHz). Prior to any access operation, the device  $\overline{\text{CAS}}$  latency and burst/length/operation type must be programmed into the DIMM by address inputs A0-A13 and I/O inputs BA0 and BA1 using the mode register set cycle.

The DIMM uses serial presence-detect implemented via a serial 2,048-bit EEPROM using a standard IIC protocol. The first 128 bytes of serial PD data are programmed and locked during module assembly. The remaining 128 bytes are available for use by the customer.

**Input/Output Functional Description**

Symbol	Type	Polarity	Function
CK0	(SSTL)	Positive Edge	The positive line of the differential pair of system clock inputs which drives the input to the on-DIMM PLL. All the DDR2 SDRAM address and control inputs are sampled on the rising edge of their associated clocks.
$\overline{CK0}$	(SSTL)	Negative Edge	The negative line of the differential pair of system clock inputs which drives the input to the on-DIMM PLL.
CKE0, CKE1	(SSTL)	Active High	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self Refresh mode.
$\overline{CS0}$ , $\overline{CS1}$	(SSTL)	Active Low	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue.
$\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$	(SSTL)	Active Low	When sampled at the positive rising edge of the clock, $\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$ define the operation to be executed by the SDRAM.
VREF	Supply		Reference voltage for SSTL-18 inputs
VDDQ	Supply		Isolated power supply for the DDR SDRAM output buffers to provide improved noise immunity
ODT0, ODT1	Input	Active High	On-Die Termination control signals
BA0, BA1	(SSTL)	-	Selects which SDRAM bank is to be active.
A0 - A9 A10/AP A11-A13	(SSTL)	-	During a Bank Activate command cycle, A0-A13 defines the row address (RA0-RA13) when sampled at the rising clock edge. During a Read or Write command cycle, A0-A9, A11 defines the column address (CA0-CA10) when sampled at the rising clock edge. In addition to the column address, AP is used to invoke Autoprecharge operation at the end of the Burst Read or Write cycle. If AP is high, autoprecharge is selected and BA0/BA1 define the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0/BA1 to control which bank(s) to precharge. If AP is high all 4 banks will be precharged regardless of the state of BA0/BA1. If AP is low, then BA0/BA1 are used to define which bank to pre-charge.
DQ0 – DQ63 CB0 – CB7	(SSTL)	Active High	Data and Check Bit Input/Output pins. Check bits are only applicable on the x72 DIMM configurations.
VDD, VSS	Supply		Power and ground for the DDR SDRAM input buffers and core logic
DQS0 – DQS17 $\overline{DQS0}$ – $\overline{DQS17}$	(SSTL)	Negative and Positive Edge	Data strobe for input and output data
DM0 – DM8	Input	Active High	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect. DM8 is associated with check bits CB0-CB7, and is not used on x64 modules.
$\overline{RESET}$	Input	Active Low	The RESET pin is connected to the RST pin on the register and to the OE pin on the PLL. When low, all register outputs will be driven low and the PLL clocks to the DRAMs and the registers will be set to low level. The PLL will remain synchronized with the input clock.
SA0 – SA2		-	Address inputs. Connected to either VDD or VSS on the system board to configure the Serial Presence Detect EEPROM address.
SDA		-	This bi-directional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to VDD to act as a pull-up.
SCL		-	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from the SCL bus time to VDD to act as a pull-up.
VDDSPD	Supply		Serial EEPROM positive power supply.
Par_In	Input		Parity bit for the Address and Control bus. (1 for Odd, 0 for Even)
$\overline{Err\_Out}$	Out		Parity error found in the Address and Control bus.

## Absolute Maximum Ratings

Symbol	Parameter	Rating	Units
V <sub>IN</sub> , V <sub>OUT</sub>	Voltage on I/O pins relative to V <sub>SS</sub>	-0.5 to 2.3	V
V <sub>DD</sub>	Voltage on VDD supply relative to V <sub>SS</sub>	-1.0 to 2.3	V
V <sub>DDQ</sub>	Voltage on VDDQ supply relative to V <sub>SS</sub>	-0.5 to 2.3	V
H <sub>STG</sub>	Storage Humidity (without condensation)	5 to 95	%

**Note:** Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Operating conditions

Symbol	Parameter	Rating	Units	Note
T <sub>CASE</sub>	Operating Temperature (Ambient)	0 to 95	°C	1,2,3
T <sub>STG</sub>	Storage Temperature (Plastic)	-50 to 100	°C	
H <sub>STG</sub>	Storage humidity (without condensation)	5 to 95	%	
H <sub>OPR</sub>	Operating Humidity (relative)	10 to 90	%	
P <sub>BAR</sub>	Barometric pressure (operating & storage)	105 to 69	K Pascal	4

Note:

- Case temperature is measured at top and center side of any DRAMs.
- t<sub>CASE</sub> > 85 °C → t<sub>REFI</sub> = 3.9 μs
- All DRAM specification only support 0 °C < t<sub>CASE</sub> < 85 °C
- Up to 9850 ft.

## DC Electrical Characteristics and Operating Conditions

(T<sub>CASE</sub> = 0 °C ~ 85 °C; V<sub>DDQ</sub> = 1.8V ± 0.1V; V<sub>DD</sub> = 1.8V ± 0.1V, See AC Characteristics)

Symbol	Parameter	Min	Max	Units	Notes
V <sub>DD</sub>	Supply Voltage	1.7	1.9	V	1
V <sub>DDQ</sub>	I/O Supply Voltage	1.7	1.9	V	1
V <sub>SS</sub> , V <sub>SSQ</sub>	Supply Voltage, I/O Supply Voltage	0	0	V	
V <sub>REF</sub>	I/O Reference Voltage	0.49V <sub>DDQ</sub>	0.51V <sub>DDQ</sub>	V	1, 2
V <sub>IH</sub> (DC)	Input High (Logic1) Voltage	V <sub>REF</sub> + 0.125	V <sub>DDQ</sub> + 0.3	V	1
V <sub>IL</sub> (DC)	Input Low (Logic0) Voltage	-0.3	V <sub>REF</sub> - 0.125	V	1
I <sub>L</sub>	Input / Output Leakage Current	-5	5	μA	

**Note:**

- Inputs are not recognized as valid until V<sub>REF</sub> stabilizes.
- V<sub>REF</sub> is expected to be equal to 0.5 V<sub>DDQ</sub> of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on V<sub>REF</sub> may not exceed 2% of the DC value.
- V<sub>ID</sub> is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .

## Operating, Standby, and Refresh Currents

(T<sub>CASE</sub> = 0 °C ~ 85 °C; V<sub>DDQ</sub> = 1.8V ± 0.1V (512MB, 1 Rank, 64Mx8 DDR2 SDRAMs))

## Revision Log

Rev	Date	Modification
0.1	09/2006	Preliminary Release.
1.0	09/2006	Official Release
1.1	02/2007	Update operating condition.
1.2	04/2007	Update SPD code (Byte 21 & Byte 63)
1.3	04/2007	Added DDR2-800 information and 1st Version PCB item information.

**REV 1.3**  
05/2007

25
